Micron Power MPP℠ **Warranty & Support**

- 5-year limited warranty on microprocessor and main memory
- 3-year limited parts-only system warranty
- 1-, 2- or 3-year optional on-site service agreement for Micron desktop systems
- 30 days of free Micron-supplied software support for Micron desktop systems
- 30-day money-back policy
- 24-hour technical support

The foregoing is subject to and qualified by Micron's standard limited warranties and terms and conditions of sale. Terms and conditions of sale may vary for specific configurations. Copies of the limited warranties may be obtained on our Web site or by calling Micron.

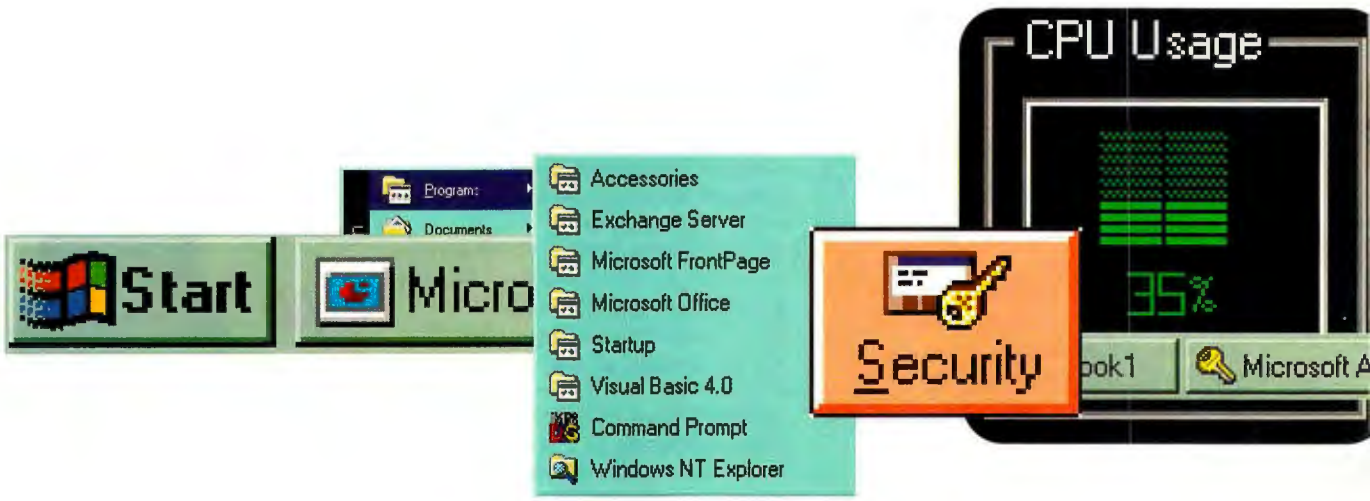
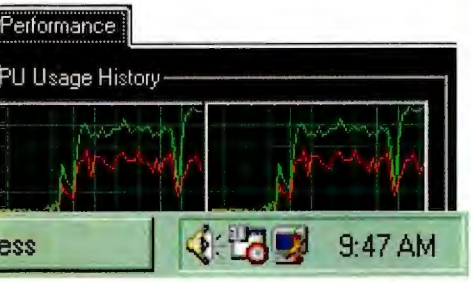
Microsoft Windows NT Workstation 4.0

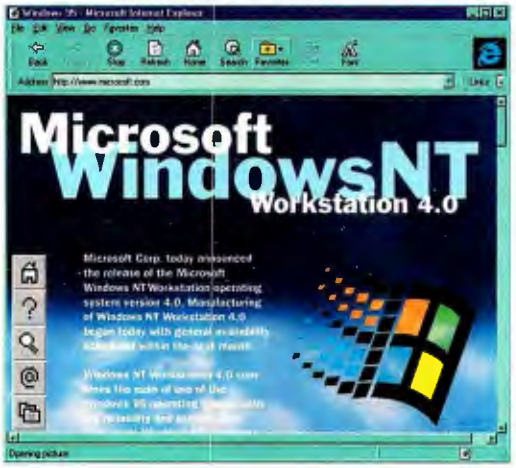
has the ease of
It has the power

It has



Windows 95.
of Windows NT.
computers everywhere drooling.





The new Windows NT® Workstation 4.0 operating system has been designed to be the most powerful desktop operating system. And because all that power is controlled by the Windows® 95 interface, it's much easier to use. The total 32-bit power of Windows NT Workstation means reliability, security, and easy access to the Internet and intranet. It's reliable because all applications run in their own memory space—so that new game beta won't crash last week's work. It's secure because integrated features let you lock your system all the way down to the file level, so you can count on applications and data being safe. It's Internet-ready because it's loaded with built-in features like TCP/IP, the Microsoft Internet Explorer browser, and integrated Peer Web Services, which lets you create a small intranet for your workgroup. And because it's all controlled by the Windows 95 interface, you can customize your system to work and look however you like. So does all this mean Windows 95 is history? Absolutely not. Windows 95 may still be your best choice, depending on your existing hardware and applications. We suggest you dive headfirst into our Web site to compare and contrast operating systems to see which 32-bit desktop is best for you.

Opticalability

Network Storage Solutions Ranging from 40 Gigabytes to 2.5 Terabytes

Reliability

Pinnacle's Optical Library Systems offer an ideal solution for archiving and retrieving databases, data warehousing and image storage applications with a media shelf-life up to 100 years.

Networkability

Users can access large amounts of data from across a network with performance near that of a local system disk. System Administrators can save time by automating jobs such as unattended backup and restore processes that typically require human intervention after hours.

Compatibility

Pinnacle Micro has developed relationships with the leading software manufacturers to ensure compatibility and long term customer satisfaction. Whether you are running UNIX, Novell Netware, Windows NT, Sun Solaris, HP UX or IRIX, we have a solution for you.

Expandability

Pinnacle's systems provide mass amounts of on-line data. Fill up your disks, remove and archive, then replace with new media for endless storage capacity.

Availability

Pinnacle Optical Library Systems are now available worldwide with a variety of service contracts to meet your needs. To receive a free copy of our ***Guide to Optical Library Systems*** *or to speak to our storage experts call:*

800-553-7070

Rewritability

Each optical library system features Pinnacle's award-winning Vertex 2.6 GB rewritable optical drive, the fastest in the industry. This system provides random access to information, allowing users to rewrite data millions of times.

Deliver Industrial-Strength Decision Support Tools and Watch the Sparks Fly!

Delivering effective decision support for hundreds o thousands of users is definitely not child's play. I takes powerful, mature tools. IQ Software's decision support tools are industrial-strength, best-of-breed products that can be deployed individually or as a total decision support solution.

IQ/Objects™ Robust Query and Reporting

For end-user query and reporting, IQ/Objects is simply unbeatable. This award-winning tool's familiar, easy-to-use Microsoft look and feel belie the awesome power of its true object-based technology. IQ/Objects supports everything from simple ad hoc queries to the most sophisticated cross tabulations. Reusable objects let users combine new queries and reports with previously saved ones to create sophisticated reports easily and quickly. A selection of templates makes it easy to create presentation-quality results in minutes.

1995 BYTE AWARD OF MERIT

IQ/SmartServer™ Three-Tier Architecture

IQ/SmartServer provides production reporting, scheduling and job monitoring facilities. This elegant three-tier architecture implementation harnesses the power of servers (UNIX and NT) to reduce network traffic and deliver a scalable, manageable, high-performance solution. IQ/SmartServer cures fat client performance problems without limiting user access to information.

IQ/Vision™ Multidimensional Analysis

IQ/Vision works directly with relational databases and Arbor's Essbase or can be implemented with its own MDDB to deliver a complete OLAP solution. For robust multidimensional and drill-down analysis, nothing is easier to use or functionally as rich as IQ/Vision. An intuitive interface displays information in interactive charts or cross tabs, allowing any user to visually slice and dice, drill up and down, nest dimensions, flip axes, and rotate dimensions – all with point and click simplicity.

 IQ Software Corporation (770) 446-8880, fax: (770) 446-0321, email: info@iqsc.com, World Wide Web: http://www.iqsc.com.

"IQ/Objects – A breakthrough technology for query and reporting tools."
Aberdeen Group
"IQ Software has brought the power of objects to mainstream business intelligence."
Patricia Seybold Group
"IQ/Vision is an extremely powerful and easy to use OLAP tool that shines with complex data."
Information Week Labs
IQ/LiveWeb™ Web-enabled Decision Support
IQ/LiveWeb links corporate databases and cyberspace, turning your intranet into a source of live database information. With IQ/LiveWeb, users can request and view reports anytime, anywhere using a standard Internet browser. IQ/LiveWeb lets you design and build database reports, charts and cross tabs. Server-based publishing makes it easy to keep those reports current. Simply tell IQ/LiveWeb the schedule. That's it. IQ/LiveWeb automatically executes your requests, refreshing the information and publishing it to your intranet.
DOWNLOAD FREE SOFTWARE
Special Offer! For a limited time, download a fully operational copy of IQ/LiveWeb, valued from $4,000 to $20,000, absolutely free. See http://www.iqsc.com for details.

editorial

Wanted: New Software

Today's shrink-wrapped applications are the last place you'll find innovation.

The search for the killer desktop app is dead, judging from the dearth of anything really interesting outside of the graphic arts/multimedia and geographic-information markets. Amidst a golden era of OSes, server software, Web stuff, and development tools, the best you can say about most desktop apps is that they are easier to install now that they come on CD-ROMs instead of floppies.

Too harsh? What was the last new client application authored by Microsoft? I come up with Access, in 1992, and even it wasn't totally homegrown in Redmond. This year's FrontPage was acquired in full, although it has since been seriously reworked. Lotus's now-defunct Improv came out for Next in 1990 and for Windows in 1993. Apart from these few, all we've seen are continuing improvements (albeit not unappreciated ones) to existing suites, accompanied by feature bloat.

"Who cares?," ask the Webmeisters. "With Hypertext Markup Language [HTML], Java, a browser, and plug-ins, shrink-wrapped software is a dinosaur."

The Web is a powerful tool, and it really has changed everything. The ferment in Web tools and server applications will obviously produce profound innovations—probably even one of those legendary paradigm shifts.

But I'm not buying into the idea that server apps will completely replace desktop apps in this decade. The bandwidth and network reliability are just not there. And ultimately, whether software vendors write applications in giant hunks of C++ code and deliver them on CD-ROMs—or write them in small pieces of Java code and wire them to us—apps will still need to be more innovative.

Nor will custom development replace packaged software, even if the most optimistic scenarios about programmer productivity and code reuse come true. No company has the time or money to be its own sole source of software.

The greatest innovation in computing since the invention of the microprocessor has been shrink-wrapped software. The ability of computer professionals to deliver fast, inexpensive solutions will, for the foreseeable future, depend on the weaving together of custom and shrink-wrapped server and client applications.

My hope is that the industry will do something more than just add HTML converters to five-year-old apps. For example, seven years after Hewlett-Packard unveiled its ultimately unsuccessful NewWave shell for Windows, I'm still waiting for easy-to-use but powerful agents.

Want thankful users? Give them software that automates the repetitive yet complex tasks that consume most workdays. I would love something that I could "program" to gather memos, spreadsheets, e-mail, and whatever else I need to assemble monthly reports.

The greatest innovation in computing since the invention of the microprocessor has been shrink-wrapped software.

My impression that the software industry has entered a slacker phase was reinforced by a recent trip to Xerox's fabled Palo Alto Research Center. At PARC, you can see real innovation in areas as conceptually simple and practically difficult as viewing large amounts of data (an entire company organization chart, for example) quickly and easily. The kinds of inexpensive graphics hardware discussed in this month's cover story open up even more possibilities in this arena.

Maybe it's hard for concepts like data visualization and cross-application agents to clear the hurdles that large software companies put in front of new product development. I imagine that any product manager with fire in the belly still has to answer to company bean counters who ask, "Is there a $100 million market for the product this year?" I sure hope that someone out there is looking beyond today's installed base.

When I go to Comdex next month, I'll be looking for interesting and practical new desktop applications to present our Best of Comdex awards to. (Vendors: See http://www.byte.com/vpr/vpr.htm for details.) Tell me what you need from shrink-wrapped software in our forum at http://www.byte.com. I'll carry the message back to the software industry.

And you can take your business there on a Macintosh.

As V.P. and resident visionary for QUALCOMM—one of the brightest stars in digital wireless communications—Tom Lafleur is finding innovative ways to stay ahead of his company's phenomenal growth with the help of the World Wide Web and Apple® Macintosh® computers. In fact, Tom started QUALCOMM's Intranet by running one of their own products on a Mac®—Eudora®, which has since become the most popular e-mail software for the Net. Today, people are using Macintosh to easily create web pages and share details of their projects with the rest of the organization. So engineers have instant insight into manufacturing problems, can pull up drawings and quickly resolve issues. Which has slashed the need for paper. Cut support costs. And sparked unprecedented collaboration. Not to mention knocking a few walls down along the way.

For more information on Apple products and solutions, or to subscribe to our electronic newsletter, visit us at www.solutions.apple.com/intranet

START REPLACING WALLS WITH WORDS.

It's time to remodel. And the Apple® Internet Server Solution is one of the fastest, easiest ways to transform your company. By dramatically improving communications. By unlocking hidden information. By knocking down a few walls.

With it, you can easily turn your network into an Intranet – an information warehouse where people can find answers to just about any question, and share results with just about anybody.

Now, virtually any document – from internal phone books to requisition forms to invoices – can be converted to electronic form and quickly updated. So people can more accurately and easily manage their work flow.

The Apple Internet Server Solution makes it easy for people to find new ways to communicate. Easy to support Windows and UNIX.® Easy to grow. And, since security is built in, easy to prevent break-ins.

All the software that people need to set up, author and maintain their web page is included as well. Software available only for Macintosh.® Like Adobe™ PageMill,™ which makes creating a web page as simple as creating a word processing page. No complex languages to learn. No editors or browsers to juggle.

To find out more, visit us at the web address below. And discover a whole new way to reengineer your business.

Apple Premium Server Reseller

Apple Premium Server Resellers are available to help you determine which solutions are best for your business.

You're Welcome!

Tom Thompson's "The Network in the Server" (July) is the most lucid and helpful explanation of Tandem's ServerNet system area network and its potential applications that I have seen. That includes our own internal publications. Thank you.
Matt Riesz
Senior advisory systems analyst
Tandem Computers

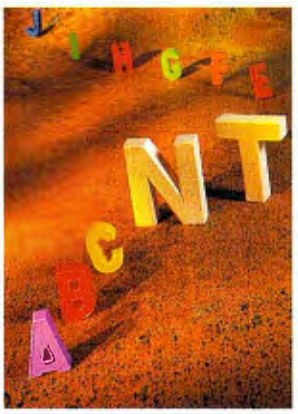
I just read "The Network in the Server" and am impressed by the clarity with which you explained the NUMA-Q architecture. Congratulations.
Kevin Joyce
Marketing manager, NUMA-Q
Sequent Computer Systems

NT Trade-offs

I enjoyed the excellent article about Windows NT, "4.0 Isn't for Everyone," by David Linthicum in the July issue. I was puzzled, however, by the absence of a fairly obvious conclusion: The considerable performance penalty imposed by the new shell and the questionable architectural changes made to accommodate it may make sense on a workstation, but they are of dubious worth on a server. With 4.0, the design center of NT seems to have shifted decisively toward the client. That's fine for me; I'm interested in NT primarily as a workstation OS—interest motivated primarily by stability. But my guess is that Microsoft will have a hard time converting server owners, whether from NT 3.51 or from other OSes.
Will Kling
Milford, NH

"4.0 Isn't for Everyone" was informative, but you make too much commotion about the kernel-mode issue. Although moving the graphical device interface (GDI) into the NT Executive gives it the potential to crash the OS, this does not seem likely. The current GDI/Window Manager subsystem is highly stable and rarely faults. The move to kernel mode only simplifies its design, making it easier to debug. Since version 3.1, all of NT's other low-level device drivers (disk device drivers, SCSI controller drivers, etc.) have operated within the Executive with a high degree of reliability. There is no reason to suggest that the graphics subsystem need be any different. If, in NT 3.51, CSRSS.EXE faults for any reason, the whole OS shuts down, as it is considered a critical process. What is the practical difference if the graphics subsystem crashes and the OS subsequently shuts down, or if the graphics subsystem crashes and takes the OS with it?
Rene Gollent
100642.1147@compuserve.com

The GDI issue involves the potential for OS failure due to reengineering of NT. The claim that the NT 3.5 kernel is inherently stable does not automatically carry forward to the next instance of the OS, considering the changes that Microsoft has made. At the beta stage (Build 1234), it was unclear how moving GDI to Ring 0 might affect stability in the final release—we were not able to crash the beta system. However, as with other operating systems that exploit Ring 0, the trade-off is stability for performance. Microsoft is selling NT as an OS that is more stable than Windows 95 and as an OS reborn for the client. The changes made to NT to sell it as a high-performance client could jeopardize its traditional use as a server OS. That's why I made an issue of it. As I write, Windows NT 4.0 is just leaving beta. We'll know who's right about the GDI issue very soon.
—David Linthicum



"NT and the Net" (July) provides a good overview of Microsoft's strategies surrounding its Internet Information Server (IIS). The discussion of the benefits of the Internet Server API (ISAPI), however, failed to give credit where credit is due. The interface now known as ISAPI was first developed as a proprietary interface by Process Software (http://www.process.com) for its Purveyor Web server for Windows NT. Late last year Microsoft and Process announced their collaboration on an open standard—ISAPI—based on the Purveyor API. To both companies' credit, DLLs written to the original API still function under ISAPI using both Purveyor and IIS.

Another Lesson Learned

As your July Web Project column was about "Lessons Learned," I am prompted to suggest this lesson: In cases where a quoted URL refers to a directory, or to the "top" of a site, almost everyone these days (including BYTE) seems to omit the trailing "/". This is wrong for at least two reasons.

First, if my browser requests <URL:http://www.some.company/directory>, an HTTP_error_302 is raised, resulting in an extra transaction between browser and server to correct the URL to <URL: http://www.some.company/directory/>.

It works, but it generates extra traffic, which contributes to an already crowded Net. Second, consider a Web server, like Zeus (http://www.zeus.co.uk/), that actually does content negotiation. You don't, for example, put extensions on image files. Instead of <IMG SRC="/images/mypic.gif">, you would write <IMG SRC="/images/mypic">.

The server looks at the HTTP_ACCEPT string and determines whether the browser can display GIF, JPEG, XBM, etc., then serves the best or smallest image accordingly. So, if we have a directory called /images/mypic/ but refer to it as /images/mypic, aren't we potentially in trouble?

Adam Shaun Nealis
adam@lbs.lon.ac.uk

I think you're right on both scores. I do try to include the trailing slash to avoid the extra bit of negotiation you describe. That's pretty well known. But the second case you bring up is really interesting. I've been only vaguely aware of progress in standards for content negotiation, but if it ends up working in the way you describe (i.e., no file extension means negotiate best type), then that would certainly be another reason we should all try to be more precise about trailing slashes. —Jon Udell, executive editor

MMX Misaligned

On reading your article on MMX performance optimization ("Programming Strategies for Intel's MMX," August), I find the example stack prologue code on page 64 does nothing to cause 64-bit alignment, only 32-bit alignment. The alignment mask should be 0FFFFFFF8, not 0FFFFFFFC.

Jan Bottorff
janb@pmatrix.com

You are correct. The assembly code listing in the text box "Maintaining Stack Alignment" contained an error and, as a result, aligns the stack to 32 bits. In order to align the stack to 64 bits, the alignment mask should be 0FFFFFFF8, as shown below.

```
Prologue:
push   ebp              ;save old frame ptr
mov    ebp, esp         ;make new frame ptr
sub    ebp, 4           ;make room for stack ptr
and    ebp, 0FFFFFFF8 ;align to 64-bits
mov    [ebp], esp       ;save old stack ptr
mov    esp, ebp         ;copy alignment ptr
sub    esp, FRAMESIZE ;allocate space
```

—Bev Bachmayer, Intel Corp.

Free PCs!

How is the system Gary Tripp describes in "Forget $500 PCs: How About Free Ones?" (Bits, August) fundamentally different from the old mainframe model? The details may differ, but we still have terminals gaining access via communication lines to a central store of information and using a central, remote processor for anything beyond trivial or presentation-related tasks. Isn't this what personal computers were invented to get us away from? And isn't it a recipe for generating insatiable demand (presuming the cost can be made acceptable) for bandwidth? The basic idea of the personal computer was and is personal control over the physical computing machinery, as well as avoidance of the bureaucracy and high priesthood that inevitably develops around a mainframe or its network equivalent, along with the requirement that you pay every time you use it. Recall how IBM became great: by leasing computing power, not selling it. When networks become the computer, at least in the form promoted by the "Web PC" types and Microsoft, computing is no longer personal; it has returned to the mainframe orientation we once rebelled against.

Mike Brady
73720.1544@compuserve.com

The PC revolution has brought us cheap computing power, but it's not cheap enough. The only way to get computing into the hands of the 75 percent of the U.S. population and 95 percent of the rest of the world that currently lack access is to change the model from a software and hardware base to a service base. Leasing won't work. Most people who need access wouldn't qualify, and necessary hardware and software upgrades require short amortization cycles. The "free PC" is a return to the central computing model, but with two changes: It is offered to the public, and it is fundamentally mobile. A service-based approach that uses PC servers connected via radio modems can give everyone access to e-mail, faxing, accounting, word processing, and the Internet, plus secure personal data storage, for about $20 a month. This approach recognizes bandwidth limitations by placing the central processor close to the user at the local ISP and connecting everyone by radio-frequency cells. Using templates stored in the "free PC" rather than applications to do most tasks reduces local processing and the amount of data transmitted. Internet usage is the bandwidth hog in the model, but if you strip out the graphics, the data stream becomes small. The "free PC" will provide mobile access but will not replace the PC for more intensive computing uses.
—Gary Tripp

OUR STORAGE PRODUCTS ARE JUST AS TOUGH. AND JUST AS GOOD-LOOKING.

When it comes to storing data, durability is a very attractive feature. So Kingston® offers a complete line of the world's most rugged and reliable data storage subsystems. Kingston's storage products were designed for the most demanding commercial environments. But they've also survived duty in tanks, submarines, and even the space shuttle. You can't buy a more reliable subsystem. To prove it, we offer a seven-year warranty — the longest in the industry. The Kingston Data Silo® DS500 tower or rack-mount enclosure can house 3.5-inch and 5.25-inch half- or full-height SCSI peripheral devices. Our Data Express® DE300 removable device subsystems, integrated into our DS500 chassis, provide an ideal housing for up to 12 removable, hot-swappable SCSI devices. Of course, Kingston storage products are compatible with all major platforms. For more information call us domestically at (800) 435-0670 or for international sales call (714) 437-3334. It could be the beginning of a beautiful relationship.

FIXES

Due to an editing error in "Adieu, Pentafluge... Hello Cyrus" (August), we described Jerry Pournelle's new Cyrix 6x86 machine as having an "EIDE CD-ROM drive running off an Adaptec Ultra SCSI board." We meant to say it has an EIDE CD-ROM drive, and a 4-GB Fast SCSI-2 hard drive running off an Adaptec Ultra SCSI board.

Due to an editing error in "Future Watch" (Bits, August, page 28), we wrote: "Because it runs at only 70 nanoseconds, EDO RAM incurs wait states at higher speeds." The sentence should have said: When running at 70 nanoseconds, EDO RAM incurs an additional wait state in systems with 66-MHz or faster bus frequency.

In our news story "Cyrix 6x86 Matches Pentium" (Bits, September), we neglected to include the SYSmark/32 benchmark results for a baseline Cyrix 6x86-based PC, without 64-MB cache. That number, 159, is comparable to the score of a 200-MHz Pentium Dell, which pegged a 161.

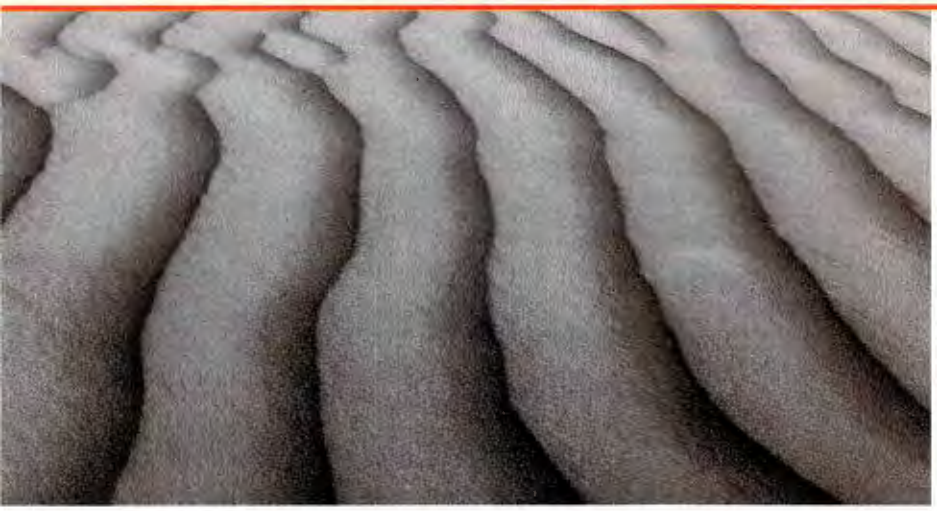
A Desktop That's Actually Capable Of

I'm no wimp. But it's pretty hot in here.

Talk about considerate. Beyond having a thermal sensor that tells you if it's too hot, the new Compaq Deskpro will warn you if its hard drive's about to fail anywhere. It's all part of what we call the next generation of Intelligent Manageability. Among other things, it

intel inside
PENTIUM® PRO PROCESSOR

TELLING YOU IT'S TOO HOT. *Cool.*



allows you to take inventory of all your hardware and software from one location. In case of hard drive failure, it backs up your data on the network; and now, thanks to our new PD-CD drive backup, it also preserves your data locally. There's even a sensor in the hood that alerts the support desk if anyone's tampered with it.

Intelligent Manageability is still based on open industry standards that ensure compatibility and integration with any network. Our partnerships with Microsoft, Novell, Intel and others give IS managers a broader range of integrated solutions. And to minimize installation and your configuration time, we provide an upgradeable integrated NIC and network-ready software which protects your investment and allows for growth. Ultimately what you get with Intelligent Manageability is lowered cost of ownership. Add to that a three-year warranty, plus dedicated toll-free technical support that's open for business seven days a week, 24 hours a day. Control. It's what makes the new Compaq Deskpro so hot. In a cool kind of way. For more information, visit us at www.compaq.com or call 1-800-392-8883.

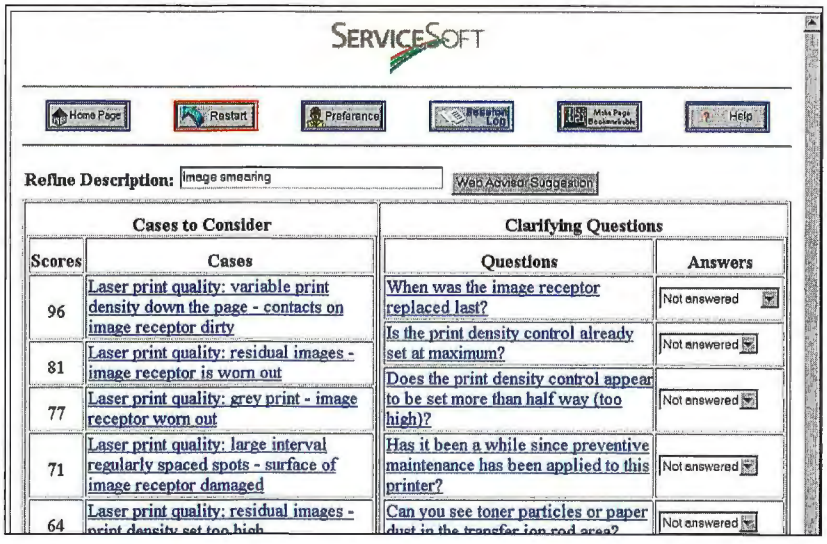
Self-Help Software to the Rescue

Call-avoidance software helps companies improve customer support and reduce expenses.

New programs for the Web let beleaguered technical-support departments reduce costs and improve service by helping users help themselves. Tech-support calls are the bane of the computer industry. They cut into profits—as much as $20 per call—and often make frustrated users wait, usually at their own expense. To reduce the number of support calls a help desk has to field, companies are turning to a new breed of product known as call-avoidance software.

Expert systems are not new: Companies have used them for years to help their support personnel find solutions more quickly. The new trend is to put answers directly into the hands of the user, potentially bypassing the tech-support phone call altogether. And the new vehicle for delivering that knowledge is—you guessed it—the Web.

"Call-avoidance programs such as our Web Advisor and Knowledge Builder won't solve every problem out there," says Keith Loris, vice president of development at ServiceSoft (Needham, MA), which recently released its first authoring tools for building Web-based problem-solving systems. "But they can reduce the number of phone calls a technical-support department has to handle. They can also ensure that the answers users get are consistent."



Programs developed with ServiceSoft's tools provide users with several possible solutions, with the most likely presented at top.

Some call-avoidance software goes a step beyond telling users how to fix a problem: Instead, the program fixes the problem automatically. For example, SystemWizard, from SystemSoft (Natick, MA), will detect, diagnose, and, in some cases, automatically fix common PC problems. SystemWizard, which should start appearing in several vendors' Win 95 and NT PCs by the end of this year, comprises several components, including a client application with a built-in local knowledge base of problem/resolution data, a server that provides a second level of support, and a knowledge

geek mystique

By our count, viewers watching the Summer Olympics on TV were, on one night, inflicted with 91 ads between 8 p.m. and midnight. Of those 91 ads, seven (about 8 percent) listed Web addresses. The Web-aware advertising companies were Reebok, Kodak, NBC, and Xerox and IBM (both twice). The next day, in the Boston Globe, we counted 121 display ads, six (5 percent) of which had Web addresses. – Jason Krause

Other Web Statistics

- Estimated percentage of adults in the U.S. using the Web: 7.7

- Projected sales to be generated by the Web in 1998 (in millions of dollars): 46,000
- Number of U.S. states with organized programs for schools on NetDay '96: 27
- Number of Internet service providers worldwide (as of July): 3054
- Estimated size of Internet access market in 1997, in billions of dollars: 2.5
- Proposed tax on Internet access providers serving Tacoma, Washington: 6 percent
- Number of U.S. states taxing on-line services: 6
- Number of domains in .COM: 316,271
- Number of private Internet providers in Egypt: 7

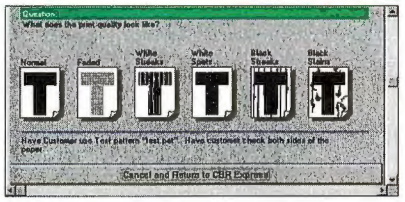
– Win Treese

builder for use by a PC vendor or MIS department to add solutions as new problems occur. If SystemWizard doesn't find a solution in the local database, the program can dial up a server, either over the Internet or the phone lines. The server can also automatically fix the problem by downloading a software solution or making some other modification.

By including a prebuilt database of solutions in SystemWizard, SystemSoft also eliminates a potential drawback to expert systems: the amount of time required for an organization to develop a comprehensive help system.

"Authoring is clearly the biggest issue," says Keith Sturdivant, manager of advanced support technology at Microsoft, which is increasing the number of self-help solutions it puts on the Web. "Maintaining the content and ensuring that the information is accurate and current in the database is important. And if you have a broad range of issues to address, as we do at Microsoft, that becomes much harder to deal with."

One difficulty is that technical-support people are often too busy solving the latest customer problem to sit down for half a day or even an hour to get information out of their brain and into the expert system. Writing a self-help program that solves problems for people who have little or no inkling about what is causing their technical difficulties still involves extensive work, even when using authoring tools that require little or no programming.



Problem resolution can be more visual than with a phone call, as shown in this application using Inference's Casepoint.

"Providing a solution for a user who doesn't have any idea what's wrong requires pretty intense authoring," says Erik Stackhouse, technical-support representative at Internet service provider UltraNet (Marlboro, MA), which is currently developing solutions using authoring products from ServiceSoft. "In that situation, you have to ask the user a lot of questions. There are so many factors involved that, from an authoring standpoint, it might be more work than it's worth." This is why companies such as UltraNet often start with a self-help system that specifically addresses a subset of common problems that can be easily solved, usually by an intermediate or advanced user. Situations involving more complex questions, novice users, or a computer that can't even get onto the Net will still require a voice call.

But even if the first implementations of Web-based self-help systems divert only 20 percent of incoming tech-support calls, this would be a huge improvement. And many vendors say that after an initial pilot phase, they plan to roll out larger, more comprehensive applications that will eventually handle 50 percent or more of incoming calls. In those situations, it's critical that call-avoidance authoring tools be able to integrate with legacy problem/resolution databases and call-tracking programs. And here the Web may again play an important role. A browser can be a single access point to a myriad of data sources, provided those databases can export into the Hypertext Markup Language (HTML) format. "If you're making the effort to author, you want it to be accessible to as wide an audience as possible," says UltraNet's Stackhouse. "Doing it on the Web is probably the best way to make this work on a large scale." **– Dave Andrews**

yeah, but...

A controversy swirling around the release of NT 4.0 involves Microsoft's limiting to 10 the number of computers that can connect simultaneously to NT Workstation. To support more than 10 people, you have to use the more expensive NT Server, which sells for about $1100. Microsoft officials say they are justified in this practice, since they have not tested NT Workstation to ensure it can support heavy usage (for example, as an Internet Web server).

Yeah, but this practice puts other vendors of Web server programs at a disadvantage. Microsoft provides a free Web server program with NT Server. Microsoft's 10-user licensing restriction essentially prevents other vendors from selling Web software that runs on the less expensive ($319) NT Workstation at an overall cost that's less than NT Server. Competing on the NT Server field means Microsoft's competitors have to play against a free product.

Microsoft can put whatever restrictions it wants on its products. If people want to use NT to host Web sites, they can upgrade to NT Server.

Yeah, but Microsoft's policy will make customers who want to use NT as a platform for Web servers pay more. And other vendors say NT Workstation easily supports more than 10 users connected simultaneously to a Web site. They also argue that Microsoft already backed down from its plan to build the 10-user limitation into the NT Workstation software. But then why did Microsoft reintroduce the limitation by putting it into its licensing agreement?

Security Gets a New Face

Here's a twist on security that gives new meaning to the word "facetime." The old definition of facetime involves trying to remember people's names as you mingle at parties. But for the U.K. company Visage Development, facetime refers to an authentication mechanism that requires users to recognize a series of faces before they can access their computers.

Instead of asking a user to remember a password or carry an authentication token, the Visage program presents a row of three faces, some of which the user has learned to recognize. Faces are typically 16-level gray-scale images, 50 pixels square, and each has a number. The faces appear for about a second before they're covered up by a masking image that hides the pictures from bystanders. Then another row of faces appears for a second and is covered up. Finally, a third row (see the screen shot at right). The user types in or clicks on the three numbers of the faces recognized; this is verified, and access is granted or denied.

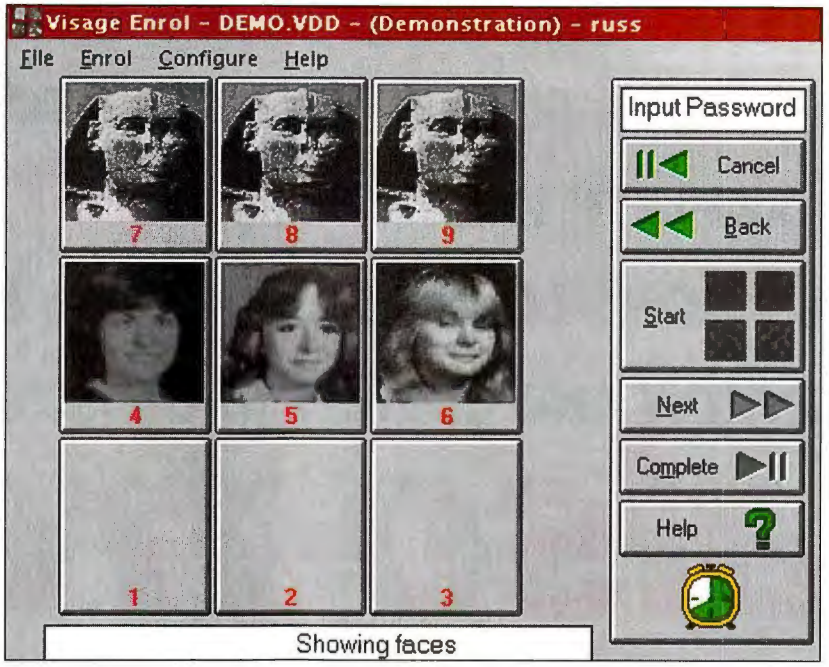
The faces are taken from a database of generic faces. Each time, the three key faces appear in different positions, and the surrounding faces are randomly selected from the rest of that database.

Visage requires an initial training period of five to 10 minutes, during which the user chooses three faces from the image database, then practices recognizing those faces. What's innovative about Visage is that it's a genuine one-time password that requires no extra hardware, does away with password changes and the attendant administrative hassles, and is easier than ever for users. No smart cards, no challenge-response number pairs, and no fingerprint readers are required. In one test, a user who left on maternity leave returned six months later and was able to successfully log in right away. Tests conducted by University of Cardiff psychologist Hadyn Ellis have verified the reliability and recallability of facial recognition as an authentication mechanism. Another test involved one group of people using Visage and another using personal identification numbers (PINs). After three months of no usage at all, the subjects were tested on their recall: Faces scored 100 percent, PINs 0.

The strength of Visage is based on our ability to recognize a face almost instantly (i.e., in about 20 milliseconds), combined with our inability to describe it in words that would let someone else pick out that same face from a group of similar ones. Also, the number of faces displayed per row, the number of rows in the grid, and the number of matches required, can all be configured to individual situations. Asking the user to pick three faces from five rows of four faces each and then to repeat with a new grid provides enough security to meet the standards of the British Computer-Electronics Security Group.

The company (contact William Visick, +01442 230471; fax +01442 212142; bvisick@cis.compulink.co.uk) is primarily interested in licensing the Visage technology, not in developing user-level products itself. Visage is currently available for NetWare 3 and 4, and a Windows NT version is nearing completion.

–Russell Kay



Visage asks users to recognize faces, rather than remembering personal identification numbers.

future watch

Coffee, Tea, or FTP?

Communications for air travelers in the future won't be so disconnected or rely so heavily on battery-powered notebooks. Delta Air Lines (Atlanta, GA), in partnership with Olin Aerospace Company (Redmond, WA), has already begun testing its first in-seat power supply system. Passengers on the airline's Spirit of Delta Boeing 767 can sit down, plug in their computers, and not worry about battery power. Other airlines are also evaluating similar in-flight power systems.

Further out are communications systems that would let airplane passengers browse the Web live. Systems such as Airview, from a company called The Network Connection (Alpharetta, GA), combine video entertainment, catalogs, PC games and applications, and possibly Web access. With Web access, travelers could send e-mail or browse competitors' sites. However, before live Web access is possible, the satellite network that planes currently use for in-flight phone and fax services will need upgrading. And there's another matter. "Before deploying any next-generation communication system," says a spokesman for United Airlines, "we're going to take a close look at how much weight they add to the airplane." **– DA**

Now you can use market-leading PowerBuilder® 5.0, together with Powersoft's new web.pb™ to build real-world applications that run on any Web server, access corporate data with our patented DataWindow™ technology, and generate HTML on the fly for your favorite Web browser.

Visit us at www.powersoft.com and you may win free products or other great prizes.

What's more, PowerBuilder 5.0 lets you create applications that run as Netscape Plug-ins for any Plug-in compatible browser. And since PowerBuilder 5.0 supports ActiveX controls, you can extend your applications' reach even further with new Internet components.

So "Web-ize" your applications today with PowerBuilder 5.0. It's available in three editions: Desktop, Professional, and Enterprise. To explore it at one of our seminars or to get more information, call us at 1-800-395-3525. And get ready to send your PowerBuilder applications into orbit.

Powersoft®

- web.pb for Web Server Development
- Window Plug-ins
- DataWindow HTML Generation
- ActiveX Support
- Multi-Tier Application Partitioning
- Compiled Code
- Designed for Windows® 95
- ObjectCycle™ for Version Control
- Native Database Drivers
- Foundation Class Library

Vendors Battle Over Next Internet File System

Browser wars, step aside. The next battle looming in cyberspace is over which file system will provide the underpinnings for better file transfer and group collaboration services on the Internet. Such a file system, whether from Sun or Microsoft or some other vendor, would improve upon the Internet's current HTTP and FTP.

Sun's proposed new standard, the Web Network File System (WebNFS), is just what the Web needs, claims Brian Croll, director of marketing for Solaris Servers at Sun. "The Internet is like a dirt road with a lot of potholes. One of these potholes is the slow speed of file transfers," Croll says. An advantage of WebNFS is its superior performance over FTP and HTTP for transferring large blocks of data, Sun says. WebNFS also lets you edit documents instead of simply viewing them as you do in today's browsers. This read/write capability will allow vendors to develop applications that let you collaborate with others from within your Web browser or Web-enabled application, without having to cut and paste text from the browser into another program.

Sun's NFS has been the TCP/IP file distribution standard for more than a decade. Not tied to any architecture or operating system, NFS is the glue that holds together heterogeneous file systems. Until recently, there hadn't been an open implementation that would work consistently over Internet connections. But with Sun's submission of WebNFS to the Internet Engineering Task Force as a proposed open standard, that's no longer true.

WebNFS springs ahead of the Net's hypertext (HTTP) and data transfer (FTP) protocols because neither of them are network file systems. HTTP must constantly close and open sockets to transfer information, and both HTTP and FTP require high latency between packets. WebNFS cuts down on both the interprocess communication and latency factors. This results in WebNFS offering block file transfers that are up to 10 times faster than the current versions of HTTP and FTP, Sun claims.

WebNFS already has powerful supporters, including Oracle and Spyglass, who are incorporating it into their browsers. Auspex, IBM, and Sequent plan to include WebNFS in their Web servers. Sun, of course, is putting all its resources behind WebNFS. The most visible sign of this support is the Netra NFS file servers, which depend as much on WebNFS as they do on HTTP for data transfer.

However, two prominent names are missing from the list of WebNFS adopters: Microsoft and Netscape. HTTP and FTP leave much to be desired for seeking, reading, and writing operations, agrees J Allard, a program manager at Microsoft. But Microsoft's remote file access protocol, called Common Internet File System (CIFS), complements HTTP. CIFS is based on the company's service message blocks (SMBs), which are already used in existing network components of Windows and NT, Allard notes, as well as on Unix.

Allard finds Sun's WebNFS speed claims to be somewhat disingenuous. "Byte Read-Range and HTTP connection keep-alive is evolving HTTP into a rival for WebNFS," he says. According to Allard, it may be too late to expect the entire Internet community to make a fundamental shift from HTTP to a new standard for file transfers.

Netscape, usually a staunch Sun ally, is still evaluating WebNFS, according to Andreas Cook, product PR manager. "Even if we turn it down now, we may use it in the future," he says.

"The big powers of the Web will fight over WebNFS. If Sun is successful, adding WebNFS will require many companies to retrofit their servers and browsers," says Ross Rubin, senior analyst for Jupiter Communications (New York City), a research firm that covers consumer online services and the Internet.

WebNFS is a threat to Netscape, says Stephen Auditore, president of Zona Research, an Internet market research house. "WebNFS plus Java is a direct competitor to HTTP and HTML," he says. "If Sun is successful in replacing the existing infrastructure, all the other major Web companies are in serious trouble." According to Auditore, Netscape is balking because WebNFS/Java would undercut all its technology dollars.

As for Microsoft, "Redmond already has its own distributed file system oriented to the NT environment and SMB, and they would love to see it expanded onto the Net," Auditore says. After all, whichever company controls the standards also controls the marketplace: WebNFS's success or failure could drastically influence Sun's and other companies' revenue streams.

Will WebNFS become the Net standard? "A lot will depend on whether Sun can gain the mind share of people using other third-party HTTP servers," says analyst Rubin. "If someone ports WebNFS to popular freeware servers, like Apache, it will be a matter of time until people start hacking together WebNFS add-ons for both Netscape's and Microsoft's browser and server product lines." If that happens, then the Web could be completely reinvented with WebNFS as its standard.

– Steven J. Vaughan-Nichols

Bug of the Month

cc:Mail: Not OK

A BYTE editor found this interesting dialog when attempting to read new e-mail using cc:Mail 2.01 under Win 95. After the editor logged in, cc:Mail announced that he had new mail. When the editor attempted to read the new e-mail, the dialog message at right appeared. When he attempted to close the dialog box, he got the dreaded ringing-bell error sound. Clicking on another application minimized the dialog, and attempting to read cc:Mail caused another instance of the same error message. Now bells were ringing in stereo. The quick-and-dirty solution: Close cc:Mail and all other applications, reboot, and try again. The next time, everything worked as expected.

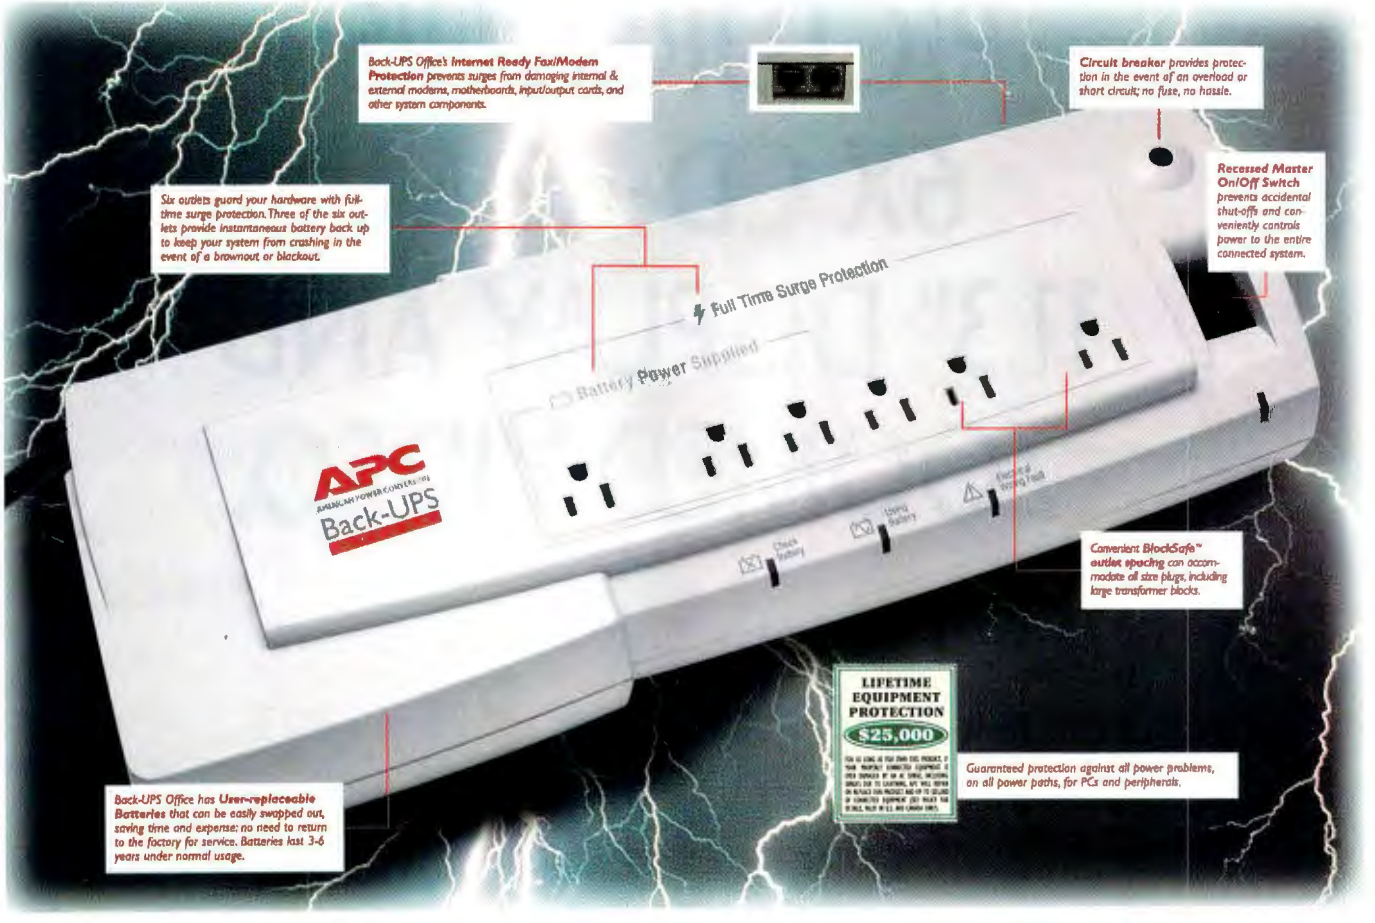
"They thought my new Multipath™ Back-UPS® Office™ was just a big surge suppressor – then the lights went out."



At last, a safe place to plug everything: Multipath Back-UPS Office for workstations, PC's and peripherals

Facing the darkness is hard, but inevitable: You have a better chance of winning the lottery than of escaping power problems: They're the single largest cause of computer data loss and hardware damage.

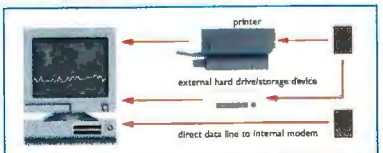
Back-UPS Office provides reliable power for your entire system. Instantaneous battery backup ensures uninterrupted operation of your CPU, monitor and an external storage device. Full-time surge suppression and site-wiring fault protection spreads a true Multipath™ safety net under any remaining integrated peripherals, like modems, printers, faxes and phone systems. Back-UPS Office also provides convenient BlockSafe™ outlet spacing to handle all size plugs – even large block transformers.

Unique Multipath protection keeps your PC and data safe

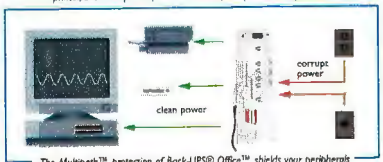
Plugging a phone line into your computer doubles your vulnerability to power problems; add any peripheral, and it triples. Even if your AC power-line is shielded, when a surge hits an unprotected peripheral, it can blaze down serial and data lines, and toast your expensive PC.

Back-UPS Office's compact design installs easily on desktop, floor or mounts to wall.

Multipath™ Means Total Power Protection



Bad power (red) can enter a computer system through multiple paths – eg. printer, data and phone/fax lines – even if computer A/C is protected.



The Multipath™ protection of Back-UPS® Office™ shields your peripherals and guards your computer from bad power on every path, providing clean, safe power (green), to your entire system.

Multiple peripherals and data lines to and from your system are vital, but dangerous. Without them, you can't do your job. However, if a power sag makes your modem drop the line while you're downloading from the Internet, or locks your keyboard before you've saved work, you lose time, money and spend another late night at the office to meet your deadline.

Back-UPS Office protects your entire system

Until now, protection for your entire system required several devices. But multi-device protection can leave you vulnerable to line noise and unwanted data glitches created by the voltage differential between outlets. Those glitches are prevented with the Back-UPS Office common voltage reference.

Back-UPS Office means true Multipath™ protection, clean, safe power to every peripheral, and instant battery backup to keep your cutting edge system and O/S from crashing. It means protection for less by integrating the security of a surge suppressor with the power of a UPS, guaranteed up to $25,000.

APC has won more awards for reliability than all other brands combined

FULL-MOTION VIDEO
With Toshiba's Zoomed Video technology and a ZV PC Card, you get full-screen, full-motion video and MPEG support without sacrificing system performance.

11.3" dia.

800 x 600 RESOLUTION
Sure, the screen is huge. And it also has 800 x 600 resolution, which means that every inch of viewing area delivers crystal-clear definition and vibrant colors.

PENTIUM® PROCESSOR
A 100MHz Pentium processor and 40MB of EDO memory can speed up any multimedia presentation. Plus, the 2.9v processor was designed specifically to maximize notebook battery life.

ADVANCED MULTIMEDIA
With a 6X CD-ROM, microphone, speaker and stereo headset, Satellite Pro offers the most advanced multimedia features you can get at this price.

EXPANSION
Satellite Pro's two PC Card slots unlock a world of expansion capabilities. And the optional NoteDock™ I Enhanced Port Replicator offers additional PC Card slots as well as easy connection to your desktop setup.

INTRODUCING THE NEW SATELLITE PRO.™

When it comes to multimedia features, the Satellite Pro offers the big picture at a small price. It all starts with a huge display and full-motion video to make your multimedia presentations look more like feature films. And it's easy to take your show on the road with a 100MHz Pentium processor, up to 40MB of memory and a massive hard drive. Add to that a 6X CD-ROM, integrated AC adapter and PC Card slots and you've got more than you need to get the job done. So when you want some real portable power, pick up the Satellite Pro. No other notebook can give you so much for so little. **For more information visit the Toshiba website at http://computers.toshiba.com, or for a dealer near you, call 1-800-457-7777.**

Photo Quality Arrives for Low-Cost Printers

Ink-jet printers were once the poor substitute for people who couldn't afford a laser printer. Now, these inexpensive devices are delivering much that laser printers can't, including near-photorealistic images at a fraction of the price.

Improvements in ink formulations, dot-placement accuracy, and better software are all combining to produce the best-looking color ink-jet output yet for personal desktops. And the prices are coming down to staggeringly low levels for this type of output.

An excellent example is Epson's Stylus Color 500C, which puts the company's 720- by 720-dots-per-inch (dpi) output technology in a printer expected to sell for about $279. The 500C produces sharp black text, but the real attraction is the photo-quality output. Samples printed on coated stock were as close to conventional photographs as we've seen from a color ink jet, regardless of price. The Epson prints black text at up to 4 pages per minute (ppm) and color at about 1 ppm or slower.

Hewlett-Packard is countering with its midrange model, the 693C. This printer produces laudable photo-quality output in its basic mode, but HP has added an optional ($49) photo cartridge for even higher-quality output. Inserting the photo cartridge in place of the black ink cartridge produces a much wider range of possible colors, resulting in smoother and better looking output. The results we saw were very impressive, making the HP competitive with the Epson, though it is somewhat more expensive ($349) and does not come ready to work with a Mac.

Canon's latest iteration of its BubbleJet technology is the BJC-4200, which prints at 720 dpi for crisp, lifelike images. Canon offers specialty neon inks for the BJC-4200, though it has no photo-specific inks like HP. List price is $399. Canon's BJC-240, also new, sells for $179, but it's slower than the BJC-4200: 4 ppm in black and white and way under 1 ppm in color

Lexmark's latest, the Color Jetprinter 2050 ($299), prints black or four-color output at 600-dpi resolution. The company rates its speed as up to 5 ppm in black and 2 ppm in color. Lexmark offers an accompanying line of special paper for high-quality photographic reproduction.

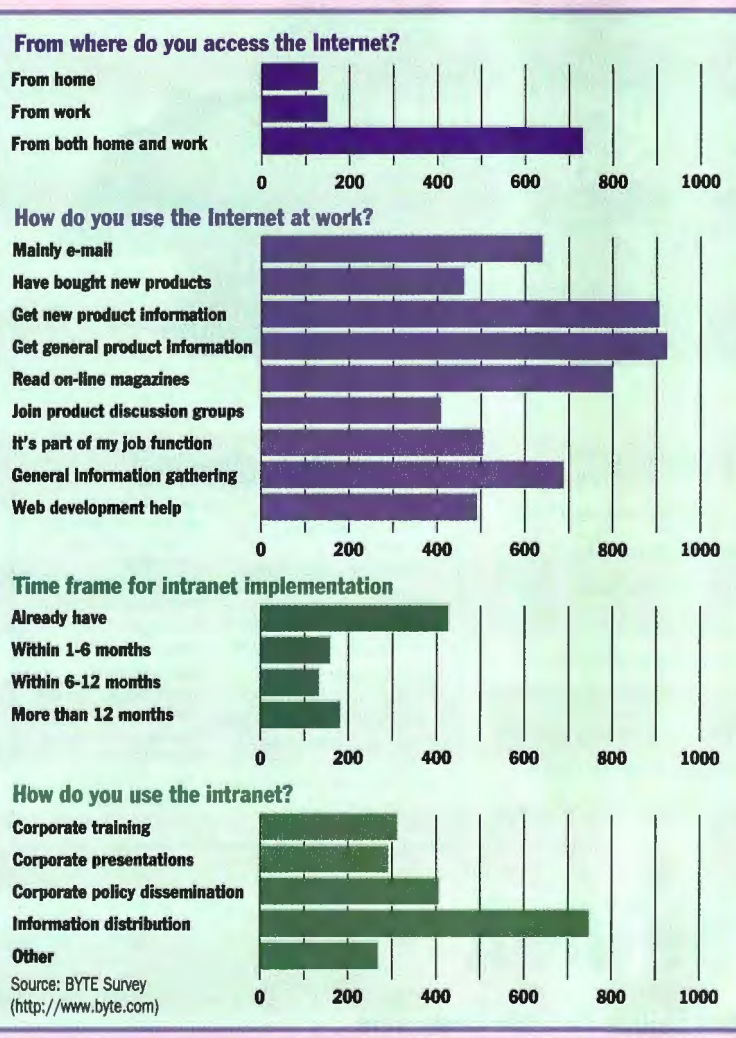
These color ink jets aren't perfect. They are slower than laser printers when it comes to high-volume black-and-white output, and they can be very slow when producing photo-quality color pages (as much as 3 minutes or more a page). Still, at these prices, they make color printing very affordable. **– Jon Pepper**

COLOR INK-JET PRINTERS

	Text Speed	Color Speed	Resolution	Cost	Photo Color
Epson Stylus Color 500	4 ppm	2 ppm	720 x 720	$279	Yes
Canon BJC-4200	5 ppm	1 ppm	720 x 360	$299	Yes
HP DeskJet 693C	3 ppm	1 ppm	600 x 600	$349	Yes
LexMark Color JetPrinter 2050	5 ppm	2 ppm	600 x 600	$299	Yes

Note: HP and Canon require optional cartridges for true photo color output.

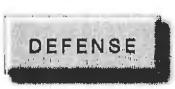
Internet/Intranet Survey



"Now that my company is on the Internet, will a fancy port scanner algorithm make

mincemeat

of my firewall?"



The Internet lets your company open its doors to millions of potential customers, partners and contributors and, unfortunately, some potentially dangerous hackers, crackers and online troublemakers.

That's why we at IBM have some dedicated hackers of our own. We call them "ethical hackers." Working with the IBM Global Security Analysis Lab, these scientists explore the cutting edge of hacking techniques to develop better and better security countermeasures. And, as part of IBM's Security Healthcheck, they'll even try to break into your network (with your permission, of course) to look for weak spots and strengthen defenses.

Where the healthcheck leaves off, IBM's Emergency Response Service takes over. On call 24 hours a day, seven days a week around the globe, the response team makes itself intimately familiar with your network and systems ahead of time so that, in an emergency, they can respond quickly to close the breach and fix the problem.

To learn more about IBM's IT Security Consulting, Security Healthcheck, ethical hackers, the Emergency Response Service and all the products and services in the IBM SecureWay™ family, visit us at www.ibm.com/security or call 1 800 IBM-7080, ext. G121.

Solutions for a small planet™ IBM®

New Products Make Backing Up Easier

Most PC users look forward to backing up their files about as much as they look forward to a visit to the dentist. They know they have to do it, but they would prefer not to. A new round of products seeks to make the system-backup chore a little less painful.

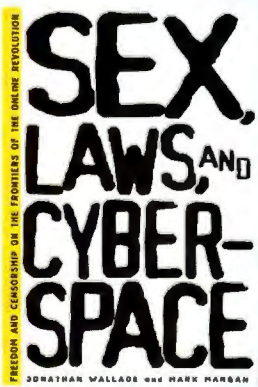
With its Zip drive, Iomega (801-778-1000; http://www.iomega.com) made backup peripherals, if not the process itself, fashionable. With 100-MB data cartridges, a cool design, and the right price (under $200), the Zip became a best seller, with a claimed installed base of more than 2 milion units. Now, Iomega and others are evolving their backup products into devices that perform a multitude of operations, such as exchanging large data files, archiving, protecting hard drives from viruses, and many other functions. Iomega has followed its 1-GB Jaz drive ($499) with a new version of its tape-backup line, called the Ditto2GB, that offers an intuitive user interface, 2-GB storage capacity, and $149 drive price ($20 per additional tape).

Syquest (510-226-4000; http://www.sales@syquest.com), known for its tape backup products, counters with its EZFlyer, a 3½-inch 230-MB removable-cartridge hard drive ($299). The EZFlyer offers more storage than the Zip, but it's also more expensive. The media itself is inexpensive at $29.95. The EZFlyer is available in both parallel and SCSI versions.

Only about 5 percent of PC users currently have some type of backup or archive device, according to Jim Porter, president of Disk/Trends (Mountain View, CA), a market research firm. "It is too early to tell what technology will dominate, but I am inclined to think none will take over a very high percentage of the PC base," Porter says. "It is like life insurance: People don't need it until they are dead, and they feel the same about backup against failures." However, when the dark day comes that your hard drive fails, you will wish you were among the fashionable minority that uses a backup product. **– JP**

Book Reviews

How Free Should Internet Speech Be?



If you believe, as I do, that free speech should prevail on the Internet, you'll find this book a friendly and informative aid the next time you argue this subject. You won't, however, find it a comforting one.

Authors Jonathan Wallace and Mark Mangan take on disturbing denizens of the Net to show why the likes of snuff fiction writers and bomb makers should not be used as excuses for restricting the Internet. Civil-libertarian-minded readers will be chilled to the bone—and their convictions tested—upon reading about the university professor who posted, in an open newsgroup, fantasies of raping and murdering a female student.

Keeping the Net accessible will ultimately place a greater responsibility on all of us to counter that which we find offensive by social, instead of legal, means. In the above case, the authors argue persuasively that prosecuting the professor for conspiracy to commit the acts he'd written about was misguided; more effective and entirely justifiable was his removal by the university from his teaching post.

After an admirable attempt to boil down the legalese of several landmark court cases, the authors conclude that we should treat the Net as a series of printing presses and book stores. They chose this metaphor carefully: A long history of U.S. Constitutional law extends the fullest protection of the First Amendment to those two institutions. In contrast, virtually every advanced communications technology, from telegraph to television, has in some way been restricted by the government.

I found the printing press/book store comparison useful; it cuts through the colorful attempts by some people to portray the Internet as an invasive, irresistible deluge of information. On the contrary, it takes an act of will to connect to the Internet. And this paradigm leaves a place for responsible filtering by on-line services and parents (and room for argument about just what "responsible" means).

Mangan and Wallace sound the alarm about the political and commercial forces who hide behind outmoded arguments to gradually roll back freedom of speech. The Net has the same chance of moving humanity forward as did the first books. Also, like the printing press, new electronic media will disseminate communications ranging from the objectionable to the subversive to the broadly acceptable.

Mark Schlack *is BYTE's editor in chief. You can send mail to him at mschlack@bix.com.*

Practical Help for the Disabled

The personal computer is a powerful tool for opening the world to people with disabilities. How to make it happen is less obvious—and the subject of this book.

The focus and tone are relentlessly practical. Joseph J. Lazzaro (an occasional contributor to BYTE) is less concerned with theory than with what you can buy and use today. You'll find a surprising range of hardware and software to aid people with impaired vision, motor skills, or hearing. The descriptions that make up most of the book (and the shareware and demo programs on the accompanying CD-ROM) summarize the capabilities of each product well enough to let you make a preliminary judgment on its usefulness.

Software developers aren't forgotten. The book includes a developer's guide for writing accessible software; it's full of tips on how to design programs that don't shut out people with disabilities. As Lazzaro demonstrates, a little thought in the design phase can make the difference between software anyone can use and software that excludes people using nonstandard I/O. If you know someone who is disabled, or if you are disabled yourself, *Adapting PCs for Disabilities* is invaluable. **– Rick Cook**

to management
what a Resident
Stealthed

Evil Empire

virus is and
why it brought down
the New York office?"

ANTIDOTE

Monkey. B...Queeg...Screaming Fist. Right now there are people out there making newer, smarter computer viruses at the rate of about four a day. And the more your company ventures onto the Internet, the more you open yourself up to attack.

Fortunately, we've got the world's leading antivirus researchers on our side: a whole lab of men and women whose aim in life is to thwart viruses before they can do damage. They've developed an integrated suite of antivirus products and services you'll find in our SecureWay™ family, including the most advanced security measures in industry history. IBM AntiVirus software detects more than 6,800 strains of computer viruses, including polymorphic viruses and others previously thought to be undetectable. The system also provides false alarm elimination and infection verification. It will alert you to suspicious virus-like activity anywhere on the network. And it works across multiple client/server operating systems from Windows® 95, Windows 3.1, DOS and OS/2® Warp to Novell NetWare® and Windows NT.™

As an IBM AntiVirus customer, you get signature updates, Bulletin Board support and you can subscribe to comprehensive quarterly software upgrades and get a fully updated antivirus product every three months, including the latest polymorphic fixes.

For more on our antivirus solutions and all our security products, visit www.ibm.com/security or call 1 800 IBM-7080, ext. G120.

WHEN THE JOB CALLS FOR A PRO

Now there's a desktop PC that's flexible and sensibly priced for your office or department—the **Micron ClientPro**™. Designed for long life and reliable, affordable performance, this new PC offers years of productive and adaptable computing without costly system upgrades. And now we are matching the power and reliability of the Pentium® processor with powerful system software. Introducing the new 32-bit operating system everyone is talking about—Microsoft® Windows NT ®4.0. A network operating system known for its reliability, Windows NT features the popular Windows 95 interface for the business network and integrates built-in management and support tools. Windows NT 4.0 also offers important innovations in graphics, multimedia, business productivity and the Internet, and it has excellent mixed-platform integration, a full complement of security features, multiplatform and multiprocessor scalability, and reliability enhancement features. With Micron, you get a system custom configured to fit your office needs, network ready with Windows NT 4.0 and backed by our industry-leading Micron Power℠ warranty.

Micron Power℠ Warranty & Support

- 5-year limited warranty on microprocessor and main memory
- 3-year limited parts-only system warranty
- 1-,2- or 3-year optional on-site service agreement for Micron desktop and server systems
- 30 days of free Micron-supplied software support for Micron desktop systems; 3 free network operating system incident resolution calls for Micron server systems
- 30-day money-back policy
- 24-hour technical support

The foregoing is subject to and qualified by Micron's standard limited warranties and terms and conditions of sale. Terms and conditions of sale my vary for specific configurations. Copies of the limited warranties may be obtained on our Web site or by calling Micron.

Web Address COMbat

While the Internet community wrestles with implementing the new version of the Internet protocol that increases the number of possible IP addresses, another struggle is taking place over the shortage of domain names. The situation stems from the fact that Network Solutions Inc.'s InterNIC controls more than 90 percent of all domain names in this country, including the top-level domains such as .com, .edu, .gov, and .net. With such a limited number of domains, the selection of good domain names appears to be shrinking.

But is there really a shortage? Rosalind Resnick, president of NetCreations (Brooklyn, NY; http://www.netcreations.com/), an Internet software and marketing company, doesn't think so. The problem of companies who can't get their favorite name into the domain of their Web address is analogous to trademarks, she says. "If someone already has your name [in their Web address], then you have to come up with another name. After all," Resnick points out, "in the real world, you can't start up a fast-food chain called McDonald's because that's already been trademarked."

But that doesn't stop people from wanting just one name and no other for their domain. In that sticky sort of situation, a vendor can turn to AlterNIC (http://www.alternic.net), which lets a company get the key words it wants in its Web address by using alternative top-level domain names. By giving enterprises more opportunities to have the name they want, AlterNIC argues, it fulfills consumers' desires and helps prevent businesses from slugging it out over who gets what domain name.

Sounds good, but there's a storm looming. InterNIC believes it is the sole gatekeeper of top-level domain names and that attempts by other companies to infringe on that responsibility interfere with its legal right to control domains. Whether AlterNIC is successful in freeing up top-level domains is an open question. But it seems certain that as more companies put marketing and sales operations on the Web, some opening up of top-level domains is certain to happen. **– SJVN**

Datapro Report

Unix Survey: Users Like Reliability, Scalability, and Performance

While many users are including Microsoft operating systems in their purchasing plans, that doesn't mean they are downsizing their plans for Unix. According to Datapro's 1996 International User Ratings Survey on Unix and Open Systems, Windows NT is used in 38 percent of the organizations surveyed, and 23 percent more are planning to add NT this year. However, Unix remains popular due to its flexibility, scalability, and power, with which Microsoft currently cannot compete.

NT is the logical upgrade path for organizations that have outgrown Windows, and NT is making major inroads into Unix's low-end server market. Over the past two years, Unix vendors have reacted to market shifts caused by NT by moving to the high-end server market. For example, SCO, once considered the premier low-end Unix vendor, now markets its OS as an enterprise-class product for client/server and host-based systems.

Although users like Unix's reliability, high performance, scalability, interoperability, and client/server support, they also complained that Unix systems still cost too much, and that installation, ease of use, and user interfaces could be better. One version of Unix that received high marks for affordability is Linux, which is available for free or for a nominal CD-ROM charge. The Linux ratings cannot be considered statistically valid, but it's interesting to note that the OS scored quite well in ease of use, development tools and utilities, and of course price. It didn't score as well as the others in scalability. One reason could be that ports of Linux to RISC processors are newer to the market than versions for Intel-based PCs.

Over the years, one common complaint with Unix has been that it's too expensive. If Linux had been available 10 years ago, one can't help wonder what its impact would have been.

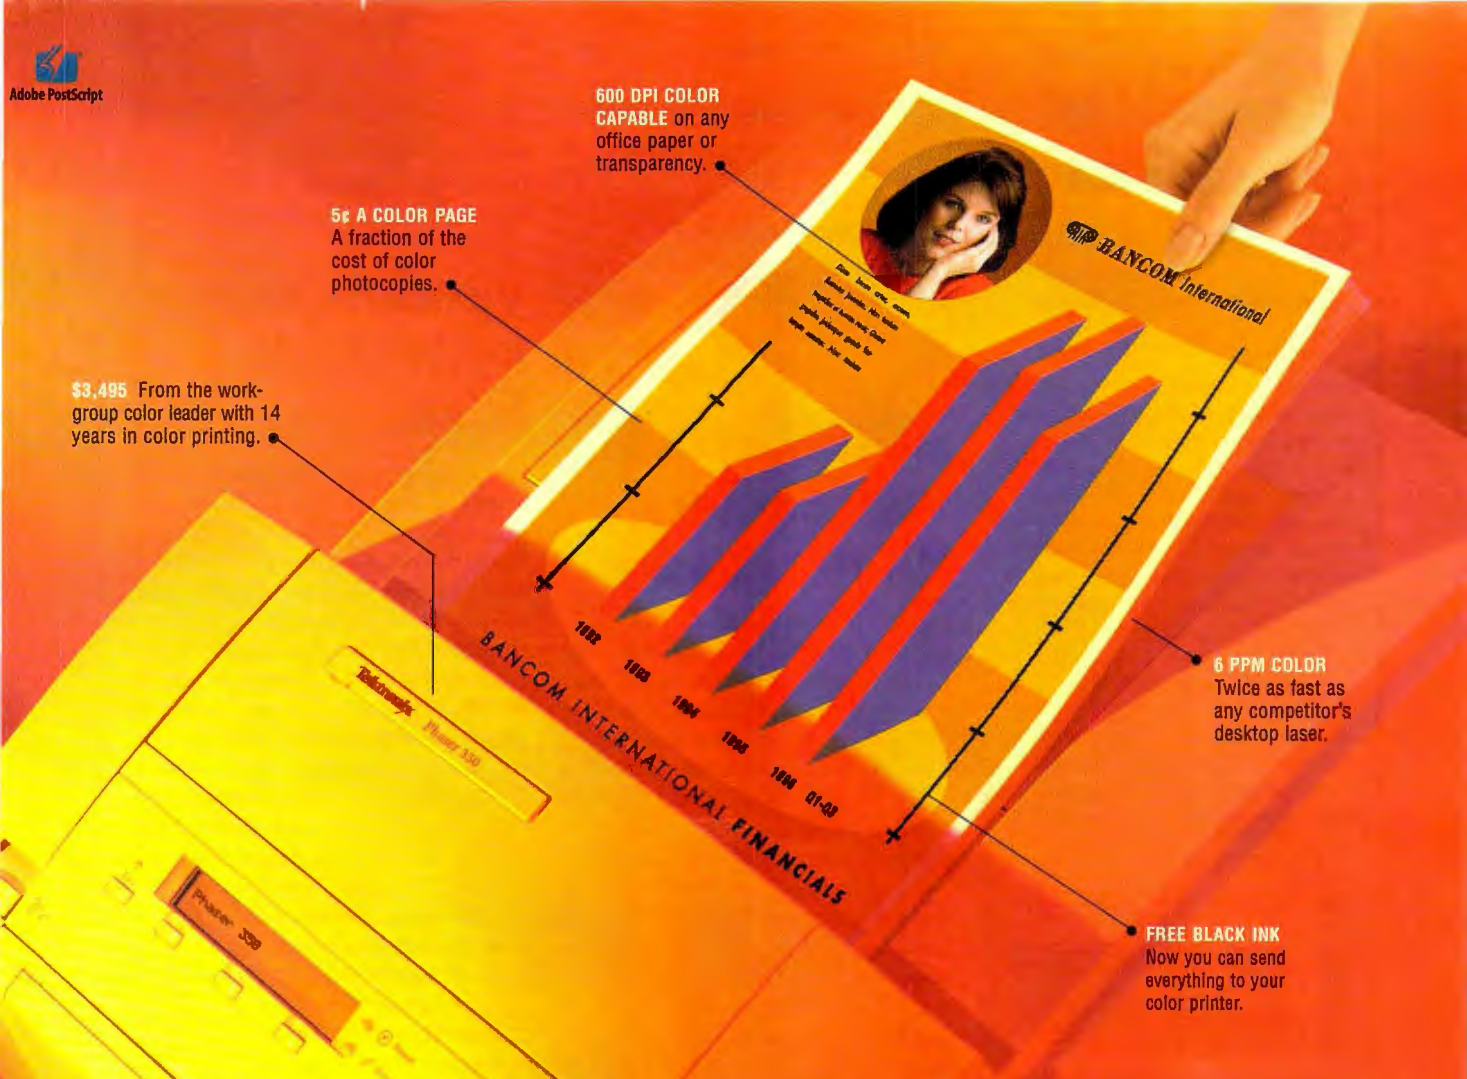
Adobe PostScript



Brilliant performance. Breakthrough price.

The new Phaser® 350 costs less to own, less to use than any other laser-class, workgroup color printer. With award-winning performance that's become the hallmark of Tektronix: RISC processing. Ample RAM. Networking. So now our incredible speed and brilliant color are the most affordable and economical, too. No wonder, at over $500 million in color printing revenue, Tektronix sells more workgroup color printers than anyone.

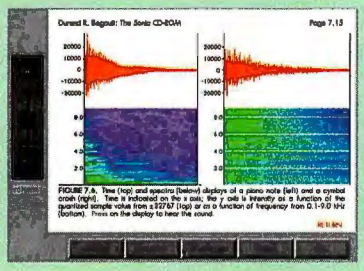
cd-rom review

Use Multimedia to Learn Multimedia

With today's new point-and-click authoring tools, anyone can toss together a multimedia project. But mastering the text, audio, video, hyperlinks, and varied production skills often required in creating a CD-ROM, Web page, or business presentation is another matter. The Sonic CD-ROM for Desktop Audio Production focuses on one special aspect of multimedia: sound.

The disc offers a thorough lesson in audio production basics, and it makes good use of plentiful examples. This product will be most useful for technicians who want to polish their sound skills.

Another valuable CD-ROM for audio production is the IEEE's Standards in



The Sonic CD covers techniques of audio production.

Computer Generated Music. This CD offers essays and documents concerning desktop music publishing, MIDI, high-level music programming, digital audio, 3-D sound, multimedia, and computer-assisted instruction.

The amount of information varies from subject to subject. The CD may disappoint people interested in a specific angle (e.g., only one study covers 3-D sound). Overall, however, this disc delivers practical information for audio developers on a wide variety of topics. **– Jason Krause**

Web Cameras Hit the Road

A new type of diminutive network gadget—cameras that snap images you can view with a Web browser—could start showing up in some unusual places, like highways and hallways and even your front door. Current network cameras from Microplex (800-665-7798; http://www.microplex.com) and Axis Communications (800-444-AXIS; http://www.axisinc.com) are 1-pound devices that can take color images and put them on self-contained Web servers at a rate of about 1 frame per second. Anyone with a standard browser can view those images, opening up all kinds of possibilities for remote surveillance and other types of applications that can take advantage of the Web.

The drawback with current versions of the Axis and Microplex products is they don't have serial ports; instead they use standard Ethernet UTP connections to a network. Both companies say they are planning new versions with serial ports. That would let a modem transmit the images over a standard phone line, thus providing much more flexibility in camera location. Who knows? Maybe one day commuters will rely on Web-enabled cameras placed along popular travel lanes to avoid rush-hour traffic; or maybe high-tech workers on the coast will use a network camera to see when the surf is up. **– DA**

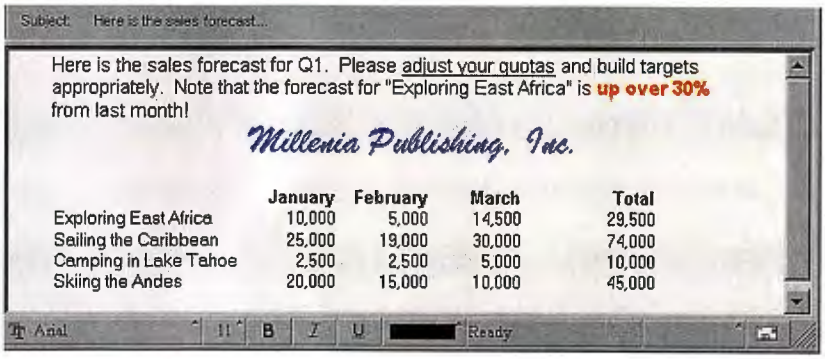
Vendors Ready Better E-Mail Boxes

If you live in e-mail, your house may be about to undergo a major reconstruction. Lotus, Microsoft, SoftArc, and others have renovated their mail client programs to make them more tightly integrated with contact management, scheduling, and other business tasks.

Microsoft's new Outlook program, which will be part of the next version of MS Office, offers a wealth of new features (for more information, see the What's New Software Preview on page 208). And Lotus has similar developments in the works for cc:Mail (see the screen below).

cc:Mail Release 7's new capabilities include basics like the ability to apply styles to individual words in a message. More comprehensive design overhauls include a user interface that more closely resembles that of Notes Mail and tighter synchronization for remote users. The interface for creating rules for handling messages automatically has been improved, and you can test those rules before making them operational. Remote users can access files on the LAN, and new message-sorting capabilities help you tailor your mailbox interface.

SoftArc's FirstClass 4.0 (slated to ship in early 1997) will integrate new calendaring features with its e-mail, collaboration, and other capabilities. Further in the future, expect closer integration of e-mail and telephony, SoftArc officials say. **– DA**



The new cc:Mail finally lets you apply styles to individual words.

There Is Only One Choice For Data Compression.

PKZIP® for Windows

GENUINE PKZIP® The Data Compression Experts® PKWARE, Inc. Since 1986™

New Version Just Released

New Features in PKZIP for Windows Version 2.50

- **Ability to create .ZIP files that span multiple diskettes**
- **Create a Windows self-extractor**
- **Self-extractor can span multiple diskettes**
- **Long file name support for Windows 95 (16 and 32-bit) and Windows NT (32-bit)**
- **Integration with Windows 95 & NT Explorer**
- **Plus additional features**

The growth of the Internet and the increased use of World Wide Web browsers are creating a greater need to compressand uncompress data files. Saving disk space and saving on-line phone charges are big benefits of compressing data files with ***PKZIP® for Windows***. PKZIP for Windows compresses files an average of 50-70% with many large text and database files compressing well over 90%. PKZIP's simple point-and-click interface lets you easily compress one file or all files on an entire hard drive, and store them in the .ZIP file. PKWARE provides the best and fastest data compression technology on the market, try it and see!

PKZIP for Windows allows you to easily open files created with PKZIP for DOS Version 2.04g. PKZIP is also compatible with Windows 3.1 or higher, Windows 95 and Windows NT.

PKZIP for Windows $49, PKZIP for DOS $47 plus shipping and handling.

To order call (414) 354-8699
or visit our Web Site http://www.pkware.com

Other PKWARE Products

Put Your Executables on a Diet

PKLITE™ increases your valuable disk space by compressing DOS and Windows 16-bit executable (.COM, .EXE and .DLL) files by an average of 45%. The operation of PKLITE is transparent, all you will notice is more available disk space! Price $46

Software developers, save disk space and media costs with smaller executables. You can distribute your software in a compressed form with PKLITE Professional.™ PKLITE Professional gives you an extra option to compress files so that they cannot be expanded by PKLITE. This discourages reverse engineering of your programs. Price $146

Put Compression Into YOUR Application

The PKWARE Data Compression Library® products allow you to incorporate data compression technology into your software applications. The application program controls all the input and output of data, allowing data to be compressed to or extracted from any device or area of memory.

The all-purpose Data Compression Algorithm compresses ASCII or binary data quickly. The routines can be used with most compatible language compilers. Separate DOS, DOS32, Windows, OS/2, Win32, UNIX and Macintosh versions are available! Call for pricing.

Blasts from the Past

5 Years ago in BYTE

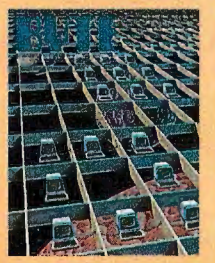
Desqview/X from Quarterdeck finally brought the X Window System to DOS, to tepid response from the market. Microsoft admitted that NT wouldn't support OS/2. Bill Gates said sales of special Presentation Manager versions of Excel and Word were dismal. Meanwhile, Lotus released the first version of 1-2-3 for Windows and the Mac. Lotus later turned its back on the Mac version. And rifts started appearing in the Advanced Computing Environment when it turned out you really would need at least two versions of source code and four compilers. Meanwhile, Compaq's new systems promised Plug and Play, but not *The* Plug and Play. Compaq's version mostly promised that you'd be able to upgrade the processor.

10 Years ago in BYTE

The Apple II GS received mixed reviews. We liked its new 16-bit processor but worried that the GS cost too much and didn't offer graphics superior to the Amiga or Atari. Also, we wondered why Apple would invest such energy in preserving 10-year-old technology.

15 Years ago in BYTE

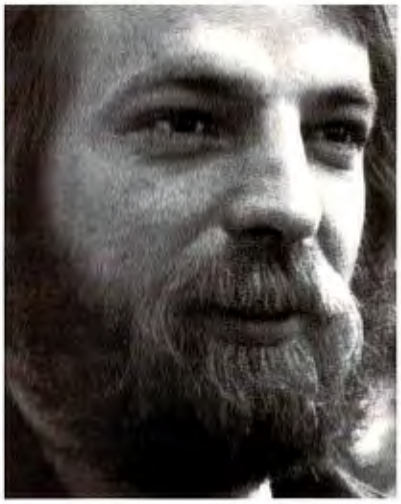
In their first good look at the brand new IBM PC, BYTE's editors were impressed and even surprised that Big Blue, known then for its big iron, could do such a swell job on a PC. We also ran a long tutorial on an up-and-coming new technology for PCs known as the local-area network.



INTERVIEW

A Dark Cloud of Bugs

Bruce Brown, president of BugNet, discusses beta software, the proliferation of bugs, and their threat to the industry.



BYTE: How did you decide to get into the bug-reporting business?

Brown: About two years ago, I had a sense that compatibility, glitches, and bugs were going to become an increasing concern to PC users. It seemed clear to me that the bowl of jelly was going to shake when Windows 95 and Windows NT 4.0 hit. I felt this was going to create a need for products and services that would help users get over, or around, these problems. At the outset, we were doing a traditional newsletter, but the newsletter is now 100 percent electronic on the Web. We also sell a database of bug/fixes in HTML, and are syndicated in a half dozen major dailies, as well as InfoWorld and Computer Currents. We also just signed an exciting new mass marketing deal with Online Interactive.

BYTE: With all the free beta software available today, do you feel that people are more willing to put up with bugs?

Brown: That's a complex question which has to be addressed from a couple of angles. Because of the need to generate revenue and sustain stock prices, there is a lot of pressure to release product as quickly as possible and to deal with bugs later. This is a fact of the business and, if anything, is becoming more prevalent, even though vendors obviously don't want to put out products which are so buggy that they depress sales. Beta is a little different, but it also plays into the software vendors' almost maniacal desire to curtail support costs. Beta looks like a dream come true to the vendors because they can say up front, "We're not going to support this," and at the same time they derive certain testing benefits from people who use a beta product and inform the company of problems.

BYTE: Why then is beta a threat?

Brown: The threat is that installing beta can screw something else up in your system. For example, in a bug that BugNet broke, it was revealed that Internet Explorer 3.0 Beta 2 running under Windows 95 replaces one or more system files with versions that are incompatible with some commercial products that you pay money for. So you install the beta and, all of a sudden, some commercial products don't work as they should. And you go to the vendor you paid money to, and now the vendor may very well say to you, "This is a beta, and we don't support beta. You're on your own." Users don't realize that the "free" program that they download may in fact cost them a lot of time and money.

BYTE: Do you think this will change?

Brown: This gets into an issue that I think is really societal. We have come into a situation where the expectations of the user are changing. There is a conflict between the expectations of the traditional users of PCs, the PC enthusiasts, and the new group, normal people who may not want to spend their weekend screwing around with their printer drivers. To make the PC an everyday appliance, this large new group must be satisfied. But these folks expect the darn thing to work when they turn it on, and of course the PC fails this basic test far too often. And so even though the industry as a whole may be doing a better job in the minds of traditional users, it may be doing worse in the minds of the users that the vendors most want to reach. And this, in turn, may be part of why such a shockingly small percentage of PC sales are made to first-time purchasers.

The eagerly awaited Lotus Domino serves up a goodly dose of Notes functionality to Web clients. By Steve Gillmor

Notes Opens Up to the Web

Domino, a.k.a. HTTP Services for Lotus Notes, gives Notes developers a powerful jump-start in creating dynamic Web sites, and it offers unique interactive tools not yet available from other major players. Domino extends Notes' proprietary architecture onto the Web, serving Notes databases to browsers on-the-fly. It loads as a Notes 4.x server task, delivering both a traditional HTTP server and the Domino engine that interacts with the Notes document and object store.

While not eliminating the need for Notes clients, Domino does give Web browsers a great deal of Notes' functionality. Users can browse multiple views; create, edit, and delete documents; perform full-text searches; download binary files; read and send Notes mail; and post documents that trigger work-flow agents.

Installing Domino on our Windows NT server required updating the Notes Release 4.1 Public Address Book and registering Web users, adding them to a special Domino Users group. You can give group members access to databases at a variety of Notes security levels. You can also create an Anonymous entry in the Notes Access Control List to give access to unregistered users.

Domino lets you customize Notes templates, databases, and forms for interactive HTTP serving.

Domino allows Web developers to leverage Notes tools such as input validation and translation formulas, hiding and revealing information based on time-sensitive and user-identity criteria, and displaying threaded discussions that are automatically indexed for querying. The "gold" release we tested supplied several sample databases, including a registration application with several agents.

With Domino, you can detect the type of client and optimize the look of a database according to whether a Web browser or a Notes client is viewing it. Domino supports the insertion of Hypertext Markup Language (HTML) code, combining HTML and Notes data and passing it to the browser. You can use HTML pass-through code to process graphics, run Common Gateway Interface (CGI) scripts, and add URL links. Browsers don't support the same rich server connections as Notes clients, so only server-based agents can use LotusScript scripting.

Domino will evolve as Web browsers acquire more capabilities. But even in its first release, this HTTP server add-in propels Notes to the head of its class. B

RATINGS	
TECHNOLOGY	★ ★ ★ ★ ★
IMPLEMENTATION	★ ★ ★ ★
PERFORMANCE	★ ★ ★ ★

TECH FOCUS

Who's on Guard?

Domino creates new security exposures. Even with optional Secure Sockets Layer encryption, there's somewhat less security when accessing the Notes environment via a Web browser. With a standard Notes client, authentication requires an authorized Notes ID in addition to a password.

Domino globally exposes all Notes databases, requiring you to manually disable confidential databases from the Open Database dialog and Catalog lists. For now, Lotus suggests putting Domino databases on a separate server, using Notes replication to update and maintain communication between Internet and intranet.

Steve Gillmor, of Southern Digital, Inc. (Charleston, SC), has extensive experience using and installing Notes. You can reach him at **sgillmor@aol.com**.

HDS's @workStation is a low-cost box for Web access, Java applets, and Windows. ***By Peter Wayner***

X Terminal + Browser + Java = Web PC

Many people are fascinated by the concept of a "network computer" that provides a low-cost way to get on the Net, browse the Web, and run Java applets. One of the first such machines to reach the market comes from HDS, which is selling an enhanced version of its X Window terminal called the @workStation. The system offers a surprisingly versatile way to give many users access to both the Web and Windows applications for as little as $750 per seat.

HDS could jump into this new market so quickly because smart terminals that run X Window are a fixture in the Unix community. These are often diskless systems with a small amount of memory that simply display whatever the workstation tells them to. HDS took these functions and added three crucial ROM-based components: a Web browser, a Java virtual machine to run applets, and NTRIGUE client software from Insignia Solutions (Santa Clara, CA) that lets you fire up Windows applications remotely. The @workStation provides excellent browsing and Java applet speed because these operations run locally on an Intel i960 embedded RISC machine.

We tested the @workStation Prima, the 25-MHz model. The basic unit ($749) comes with 8 MB of RAM, no hard disk, and a 17-inch grayscale monitor. A system with a 15-inch color monitor costs $1199, while 17-inch color costs $1499. Our test unit—with 36 MB of RAM (128 MB is tops) and a 15-inch color display—priced out at $1899.

The browser firmware, licensed from Spyglass (Champaign, IL), loads documents directly from the Web if you let the @workStation have its own IP address (which can be statically or dynamically assigned). To use Windows applications, however, you must run them remotely on an NT server that's running NTRIGUE ($1995 for five-user license, $195 per additional user). Computation is done on the server machine, but drawing takes place on the @workStation. Sending the drawing information over the network is relatively slow, but not prohibitively so.

@workStation Prima
$1899
(as tested, with 25-MHz i960 processor, 36 MB of RAM, 15-inch color display)

Circle 1059
on Inquiry Card.

The HDS @workStation uses Insignia Solutions' NTRIGUE to access Windows applications on an NT server.

We hooked our test unit through its built-in 10Base-T Ethernet connection to an AST Bravo 200-MHz Pentium Pro system running NTRIGUE. Windows performance on the @workStation was respectable, but the user interface could not duplicate the snappy response of the big machine. For example, when I typed in the NT MS-DOS editor (an old 16-bit application), screen output lagged one or two characters behind. Clearly the network limits the ability for the low-end box to compare with a dedicated PC.

If you're building a network of computers for people who occasionally use Windows applications that are not graphics-heavy, then an array of @workStations could save you money. Hooking up a dozen or so terminals to a good high-end server running NT can cut the cost of hardware and dramatically reduce system upkeep because you have to upgrade only the software on the central NT server. In terms of performance, the @workStation is comparable to that of a PC when using basic applications like word processing. It falls short when running graphics applications like games. But who plays games at work anyway? B

EO75

EO SERIES

"The HEART of an Artist"

Vivid colors. Ergonomic design. Performance and features to indulge the visionary in you.

Princeton Graphic Systems® monitors have always had a solid reputation for pushing performance barriers far beyond industry standards. This tradition was proven with the highly respected Ultra 15 which won *PC World*'s Best Buy Award a remarkable three times in a row. The 135MHz/82KHz Ultra 17+ further redefined the industry with its award-winning, high refresh rate performance and ultra-low price. Now, our **Extra**Ordinary new models surpass even our own stellar benchmarks.

Case in point, the EO75. With its super-high 95KHz horizontal frequency, 200MHz video bandwidth and an ultra-fine 0.26mm dot pitch, this 17" (15.8" viewable) monitor delivers a bold, flicker-free resolution of 1600 x 1200 @ 75Hz. That's rock-solid performance. Furthermore, our engineers added Enhanced Imaging Circuitry for a sharper focus without the moiré problems so common to other 0.26mm monitors. That's a difference you can see!

Princeton's next generation of EO monitors incorporates PreVu℠ controls and Coloright℠ technology perfect for intense, graphical applications. In addition, Princeton offers an **Extra**Ordinary, full three year "Bucket to Bezel" limited warranty*.

The EO Series is already available at your nearby dealer. See it today. Their performance will win your heart. Their price will ease your soul.

Innovative optics and integrated Adobe Player firmware make Proxima's new projector a presentation stunner. By G. Armour Van Horn

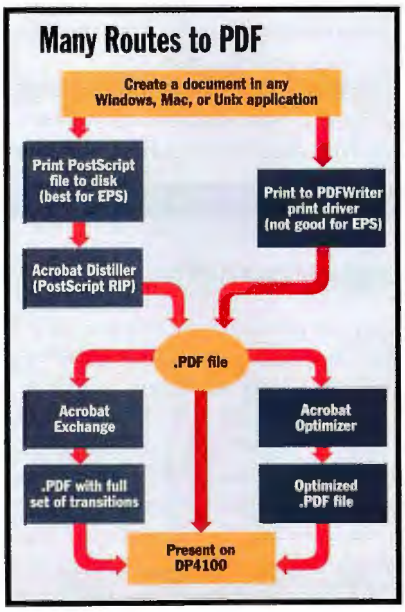
Road-Show Romance

By combining Texas Instruments' Digital Light Processor (DLP) optics and Adobe Acrobat technology into its Desktop Projector 4100Z, Proxima has set a new standard for direct digital projection systems. The $7750 DP4100Z uses DLP optics to project bright, sharp, 24-bit, 640- by 480-pixel color images through its 1.5-to-1 zoom lens. With the optional Media Express package ($1495), you can present slides in Acrobat .PDF file format without an attached computer.

After carrying the unit through several airports on a speaking engagement, I have only one complaint: its 27-pound weight. That said, the projector's brightness (350 ANSI lumens), clarity, and flexibility impressed fellow speakers.

The DP4100Z's DLP display engine uses an active semiconductor reflective surface that modulates red, green, and blue images in turn as a tricolor filter rotates through the illumination source (see "Micromirrors Project Better Images," July BYTE). The filter absorbs less light than polarizers, so the image is brighter than images from LCD-based projectors. Because the same addressable matrix forms the three component images, there is no color misregistration.

Adobe Acrobat technology turns the DP4100Z into a presentation appliance. DLP optics provide big, bright, razor-sharp images.



PHOTOGRAPH: LIGHTWORKS PHOTOGRAPHIC © 1996

The DP4100Z accepts 24-bit video from two computers, has RCA jacks and S-Video inputs for two video sources, and accepts stereo sound from all four. Other connections include a microphone jack, a serial-mouse connector, and outputs for VGA and stereo sound. Its 3-W stereo speakers face backward.

The Media Express option includes Acrobat Exchange PDF editing software (five-user Windows and Mac licenses; Unix is optional), an internal floppy drive to hold PDF presentations, and a plug-in cartridge with a Motorola 68EC040 processor and Acrobat Player firmware to present the slides. Exchange lets you rotate images (a crucial feature), establish transitions between slides (e.g., wipes, window blinds, zooms, and dissolves), crop, set display intervals, and combine different presentations. The cartridge firmware includes limited Exchange capabilities: deleting and sorting slides, adding some transitions, and setting intervals.

The optional Optimizer plug-in compresses PDF presentations. You can fit 1000 slides on a floppy disk. An optional 540-MB hard drive increases capacity.

RATINGS	
TECHNOLOGY	★★★★★
IMPLEMENTATION	★★★★

Equipped with Media Express, the DP4100Z is both a sophisticated presentation system and an "appliance" that requires only the remote control to advance from slide to slide—you can leave your notebook home. Either way, the DLP optical system is superb. B

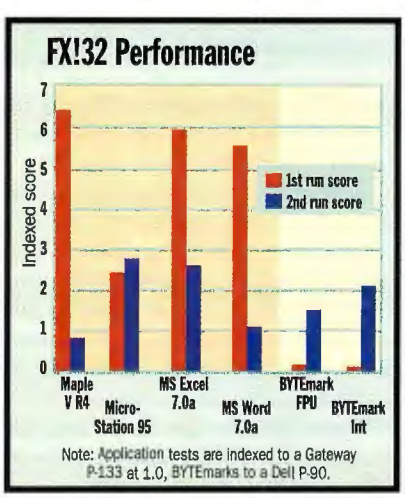
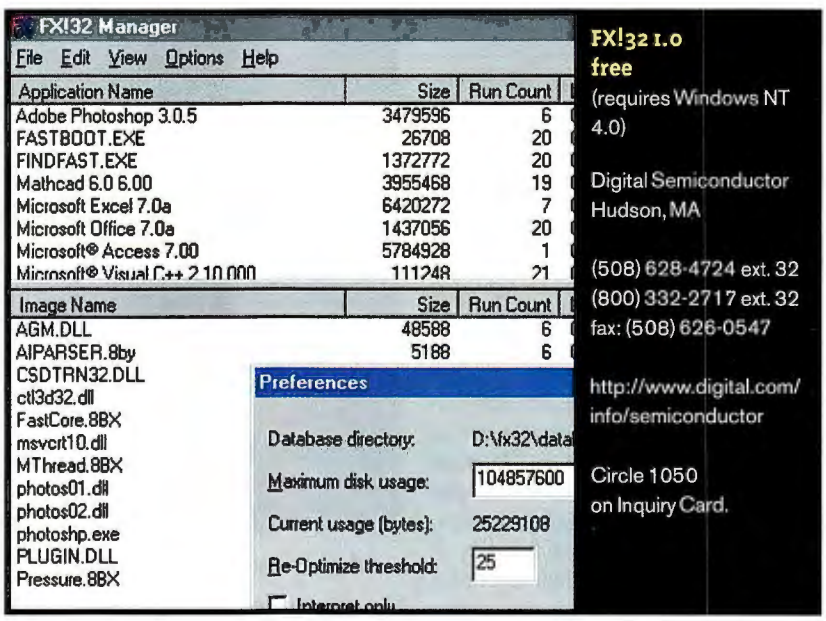
Digital's FX!32 is the key to running Win32 software on Alpha/Windows NT. ***By Selinda Chiquoine***

Alpha Learns to Do Windows

Executing code written for one CPU on another has always been like the talking dog: Though she didn't speak very well, the wonder was that she could do it at all. A new application from Digital Semiconductor has changed the way we think about emulators and what they can do. FX!32 lets you run 32-bit x86 Windows programs on Alpha/NT systems at surprising speeds. Depending on the applications and how they are used, they might run faster on an Alpha system than on a high-end Intel machine, though never as fast as native Alpha programs. In our tests, FX!32 1.0 achieved about 40 percent to 50 percent of the performance of the same code compiled for Alpha.

BYTE editors gave FX!32 the Best Technology award at Comdex last fall because it breaks the emulator mold. It looks at the instructions you're using and translates some of them into native Alpha code, saving the result in a separate DLL. It intercepts system calls and directs them to a native Alpha library. FX!32 thus combines both translation and interpretation, saving execution profiles and analyzing them heuristically (see "An Alpha in PC Clothing," February BYTE).





The FX!32 Manager reports the status of Win32 applications and background code optimization.

I tested FX!32 on a 466-MHz Alpha system with 128 MB of RAM running a beta version of Windows NT 4.0. The BYTEmark test results are summarized in the chart. The FX!32 translations ran at 47 percent (integer) and 32 percent (floating point) of native speeds. Straight emulation clocked at 2 percent to 3 percent.

I also ran scripts using Microsoft Visual Test 4.0, Word 7.0a, Excel 7.0a, Bentley Systems' MicroStation 95, and Maple V release 4. Because FX!32 translates only those parts of an application that you execute, scripts and users that use different commands and system calls will produce different results. Most applications will have a relatively slow first run and increasingly fast second or third run. After that, performance gains taper off.

You can set a maximum disk space allotment for translations, delay optimization, optimize now, delete translated code, or set optimization profile sizes. FX!32 itself takes up 10 MB. Its translations are between one and two times the size of the original code.

The real value of FX!32 is that Alpha users no longer need an Intel system to use Win32 applications. For 16-bit Windows applications, however, you'll need Insignia Solutions' SoftWindows, a traditional (slow) emulator.

RATINGS	
TECHNOLOGY	★ ★ ★ ★ ★
IMPLEMENTATION	★ ★ ★ ★

Digital will offer FX!32 free to Alpha customers and bundle it with all Alpha systems. FX!32 should end Alpha critics' cries of, "Where's the software?" B

SERVERS WORKSTATIONS LANS RAID STORAGE

built to order

High Quality Custom-Configured Systems at Off-the-Shelf Prices

Want a custom system?
Until SAG, that meant high-priced VARs and other costly consultants.

Want to save money without compromising on quality?
Until SAG, your only options were pre-configured systems and their many limitations.

Precision-Engineered Power Systems
Now you can have custom quality configurations without compromise. All SAG workstations and systems are precision-built and packed with features. We offer the latest in technology with speed, data integrity, and compatibility in mind. For affordable disk arrays, tape backup solutions and RAID 5 technology, SAG Electronics is the acknowledged "High-End Solutions Company."

The Choice Web Server
Companies like *Business Week Magazine* are choosing SAG Electronics as their high performance web server solution.

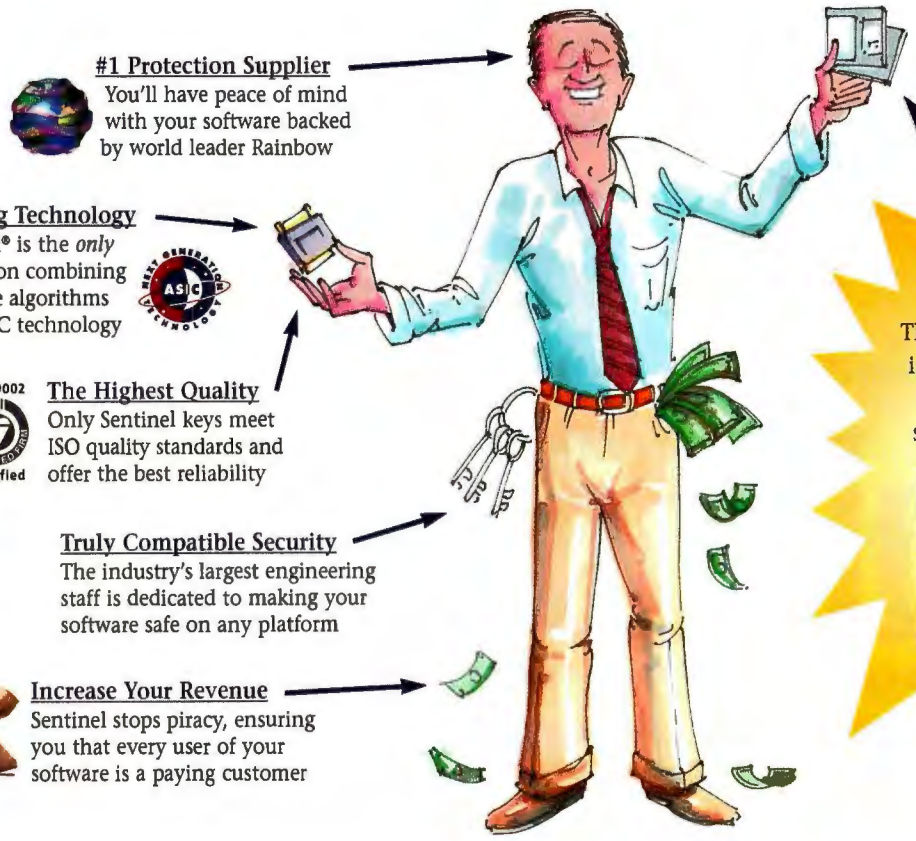
A developer's dream come true...



#1 Protection Supplier
You'll have peace of mind with your software backed by world leader Rainbow

Leading Technology
Sentinel® is the *only* protection combining multiple algorithms and ASIC technology

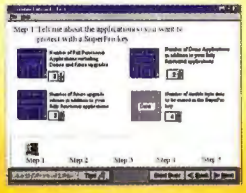
The Highest Quality
Only Sentinel keys meet ISO quality standards and offer the best reliability

Truly Compatible Security
The industry's largest engineering staff is dedicated to making your software safe on any platform

Increase Your Revenue
Sentinel stops piracy, ensuring you that every user of your software is a paying customer

NEW

The SentinelWizard™ GUI is an innovative tool that makes protecting your software easier than ever



The world's #1 software protection is now the easiest to implement!

You've always dreamed of superior software protection that was simple to integrate into your entire product line. The new SentinelWizard makes your dream a reality.

Just tell the SentinelWizard how you want to sell your products. It then automatically configures your Sentinel keys and generates the pseudo code necessary to complete the protection process.

Call now to order *your* **Sentinel Developer's Kit, featuring the SentinelWizard.**

New Windows 95 features assist computer users who have disabilities. ***By Joseph J. Lazzaro***

Windows 95: Aiding the Disabled

If you run an office staffed with more than 15 employees, you must comply with the Americans with Disabilities Act. This may require that you provide adaptive hardware and software on office workers' computers. Such equipment enables workers with disabilities to accomplish many tasks independently. For example, if you are blind, it can transform on-screen text to synthesized speech or braille. If you can't hear, adaptive hardware transforms a computer's audible cues into a visual format.

So far, adaptive technology has consisted of third-party add-ons to OSes, with the exception of the Mac. This has resulted in adaptive equipment that only sometimes works. Fortunately, because of lobbying by the disabled community, OS vendors have begun to embed adaptive-access features directly into their OSes. This makes such features widely available right out of the box, more reliable, and a lot less expensive.

Microsoft began to build a suite of disability-access features starting with Windows 3.x. Win 95 offers access to a built-in set of utilities that accommodate users with hearing, motor, and some visual disabilities. Furthermore, the Win 95 Help system includes information on these built-in accessibility features.

The control and configuration of most of these features are centralized in an Accessibility Options Control Panel, as shown in the screen at right. This Control Panel lets you activate or deactivate specific access features and customize timings and feedback for certain utilities. It also lets you set hot keys so that you can activate these features quickly.

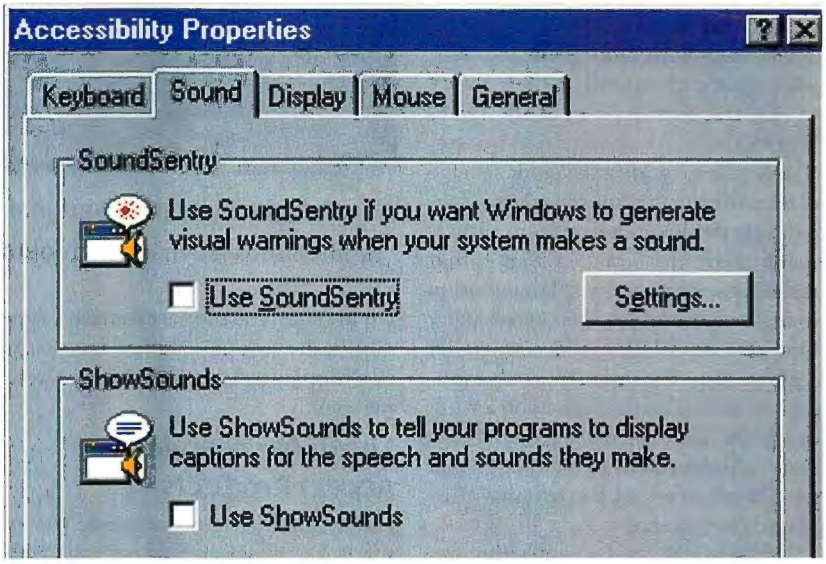
Keyboard and Mouse

Using a keyboard requires a significant amount of hand dexterity, particularly when using the modifier keys, such as Shift, Control, and Alt. For persons unable to use a standard keyboard or mouse easily—if at all—several Win 95 utilities can help by altering the keyboard's behavior. You can configure these utilities in a pane on the Accessibility Options Control Panel.

The StickyKeys utility, for instance, helps you type capital letters or manage complex key sequences, like Control-Alt-Delete, that require the use of both hands. StickyKeys lets you press one key at a time in a sequence instead of pressing multiple keys simultaneously.

Another powerful utility, FilterKeys, helps users who accidentally strike keys by filtering out those keystrokes that do not fall under a user-definable time duration. In other words, for a key press to become a valid keystroke, it must be held down long enough to register. Any keystrokes that don't last for the specified duration are discarded.

ToggleKeys is a utility that provides audio feedback for certain keystrokes. This is a useful tool for computer users who are unable to determine the status of the keyboard's modifier keys by using any other method. The ToggleKeys utility provides both high- and low-pitched beeps that indicate the current status of the Caps Lock, Num Lock, and Scroll Lock keys.



You can configure Win 95 to accommodate users with hearing, motor, and some visual disabilities.

Driving a mouse demands strong hand/eye coordination and good hand/arm agility. It's a prerequisite for using the GUIs on many of today's desktop computers. MouseKeys assists users who have difficulty pointing the rodent. The program lets you use the arrow keys on the keyboard's numeric keypad to move the mouse pointer around the screen and emulate mouse actions, such as clicking, double-clicking, dragging, and dropping. Holding down the Control key accelerates pointer movement, while holding

down the Shift key propels the pointer a pixel at a time, offering fine-grained control.

Video and Sound

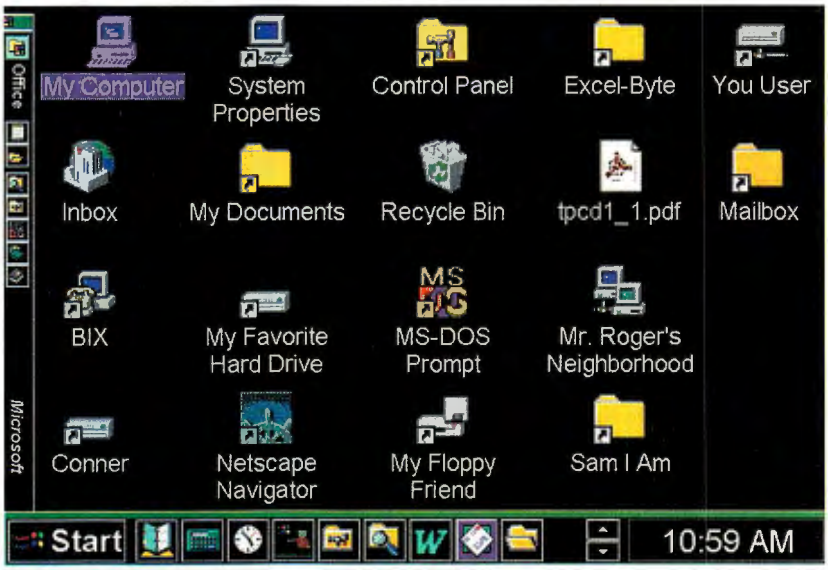
For persons who have difficulty seeing images on a standard computer screen, Win 95 offers several features that make the monitor easier to see. Some of these features are simply a matter of adjusting certain Control Panel settings. For example, if you are visually impaired, you can use the Display Panel to scale the size of various user-interface elements, such as window titles, scroll bars, borders, menu text, and icons.

The Mouse Control Panel allows you to adjust the mouse pointer's characteristics. You can select from among several sizes (small, medium, and large), which is valuable for users with limited vision or learning disabilities. You can also adjust the pointer's color and apply animation effects to increase its recognition factor and visibility.

For users with limited vision, color plays an important role in their ability to read comfortably—or at all. Again, Win 95's built-in customization features enable you to modify the color scheme of the environment. You can select a high-contrast mode or choose from several ready-made appearance schemes that make it easier for users with limited vision to focus on the screen. The Accessibility Options Control Panel allows you to set a global flag that instructs your applications to employ the high-contrast color scheme, as shown in the screen above. It also enables you to avoid schemes that are difficult to see, such as text that's displayed over pictures.

For users who are deaf or hearing-impaired, Microsoft has implemented several useful features into Win 95 that increase access to the computer and its data. This is of vital importance as many applications begin to use text-to-speech or audio playback.

Win 95's SoundSentry lets you have sounds presented in an alternative format, such as visually or through text captions. ShowSounds lets you set a global flag that displays sounds in a visual format. This can be accomplished by several methods, depending on your preference. For instance, you can have the active window flash every time a sound is generated or display text captions that represent the sounds.



A high-contrast layout makes for easy reading, but not all applications (such as the toolbar on the left) support this feature.

Third-Party Speech-Access Products

Despite all these improvements, Win 95 still lacks critical support for users who are totally blind and must rely on speech-synthesis systems to read the information on a computer screen. Microsoft plans to implement an off-screen model that captures on-screen information so that special-purpose software can perform a text-to-speech conversion on it or drive a braille-output device.

Unfortunately, the hooks to this mechanism might still be unavailable when this article sees print. This sorry state of affairs presents an opportunity for third-party access technology, chief among them speech- and braille-output packages designed to read the screen.

The Automatic Screen Access program for Windows (ASAW), from MicroTalk, is one of the latest Win 95 screen readers to enter the market. ASAW works with Win 3.x and Win 95 applications. Biolink's ProTalk32 is a screen reader for Win 95. A Win 3.x and NT version is also available. Winvision, from Artic Technologies, runs on both Win 3.x and 95 and supports several commercially available speech synthesizers. Winvision also drives braille displays, providing a tactile representation of Windows screens. Syntha-Voice's Window Bridge, which runs under Win 3.x, Win 95, and DOS, was the first Windows-based screen reader to enter the adaptive market.

Computers play a major role in our society; they're used at home, at school, and on the job. It only makes sense for OSes to provide adaptive-access features. This makes the computer accessible to everyone, no matter what their abilities, so they can make a contribution in the workplace. Microsoft has done a commendable job so far with much-needed improvements to Win 95. But the company still has a lot of work to do if Windows is going to provide OS-level support for blind computer users. B

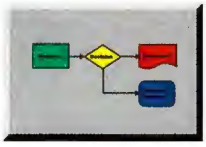
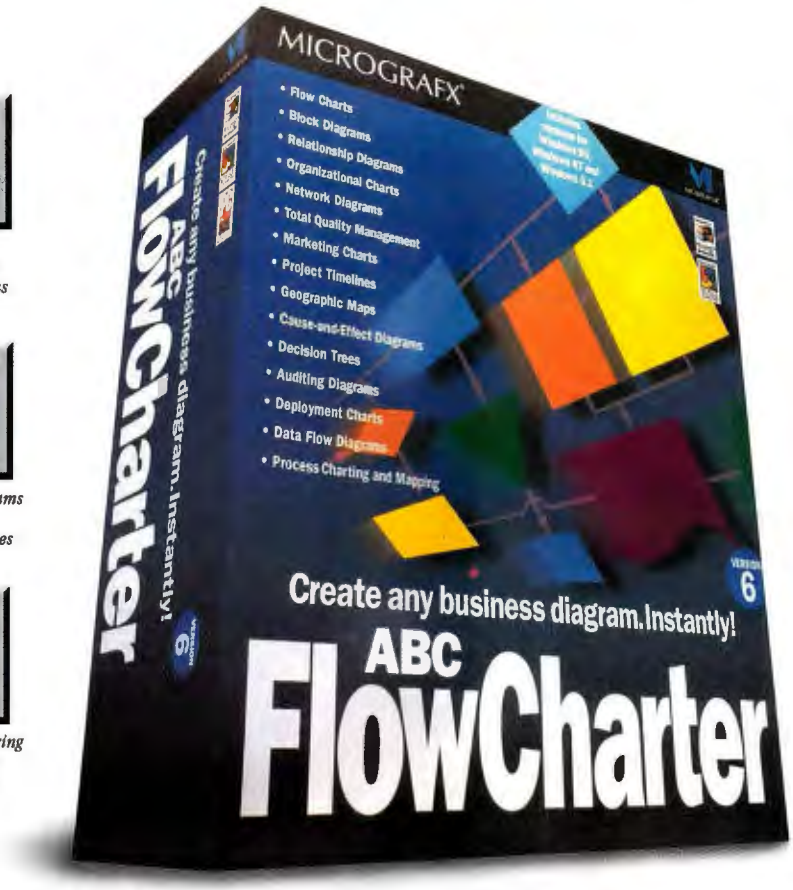
Human resource tools like organization charts and relationship diagrams

Management support diagrams like cause & effect, decision trees and timelines

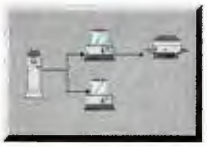


Business process re-engineering diagrams like flow charts and data flow diagrams



Marketing tools like venn diagrams, targets, pyramids and geographic diagrams

Total quality management diagrams like process charts and maps



IT and software design tools like network diagrams and object oriented design diagrams

ROCKET FUEL FOR THE BUSINESS PROCESS

Great businesses run fast. As fast as you can make obstacles disappear. That's why you need ABC FlowCharter® 6. It shows you your business. Clearly. With diagrams that add a boost to your entire business process.

ABC FlowCharter is not just another drawing tool. It actually lets you relate charts to data, and automatically analyze the results. Unlike diagramming tools that hit the wall at the edge of the page, ABC FlowCharter is powerful. It can diagram any process. Across any number of pages. No matter how complex. With lines that re-route automatically and shapes that drop into place. In fact, it's so powerful, it's used as the engine for Process Model®—the world's most advanced business simulation tool.

ABC FlowCharter does the work, while you work on making your business run better. See for yourself. Pick up your copy of ABC FlowCharter 6 today. If you want even more graphics power, you'll find ABC FlowCharter bundled in ABC Graphics Suite™. Visit your favorite reseller, or call **800-428-8716** now.

Whether your business relies on basic spreadsheets or the most advanced multimedia applications, ViewSonic® has the perfect Graphics Series monitor for YOU! In fact, our Graphics Series offers NINE different monitors, ranging from 15" through 21" (various viewables) for both PC and Mac® systems. Each provides a unique combination of performance, features, value and screen size to meet your specific needs.

Graphics Series Monitors

Our Graphics Series offer features like OnView® controls for easy on-screen adjustments, ViewMatch® to match screen color to printer output, and overscan capabilities which provides use of the entire screen. And *Plug & Play+* for easy installation with Windows® 95.

For multimedia, personnel training and internet applications, the Graphics Series PerfectSound™ 15GA and 17GA multimedia monitors are the ideal choice.

Product	CRT Size/ Viewable	Dot Pitch Aperture Grille*	Max. NI Resolution	OnView Controls	TCO Certified	MSRP
ViewSonic 15G	15"/13.8"	0.28mm	1,280 x 1,024	Yes		$425
ViewSonic 15GS	15"/14.0"	0.28mm	1,280 x 1,024	Yes	Yes	$449
ViewSonic 15GA	15"/14.0"	0.27mm	1,280 x 1,024	Yes	Yes	$499
ViewSonic 17GS	17"/16.0"	0.27mm	1,280 x 1,024	Yes	Yes	$699
ViewSonic 17GA	17"/16.0"	0.27mm	1,280 x 1,024	Yes	Yes	$799
ViewSonic GT770	17"/15.9"	0.25mm*	1,280 x 1,024	Yes		$899
ViewSonic 20G	20"/18.4"	0.28mm	1,600 x 1,280		Yes	$1,299
ViewSonic GT800	20"/19.1"	0.30mm*	1,600 x 1,280	Yes		$1,899
ViewSonic G810	21"/20.0"	0.25mm	1,600 x 1,280	Yes		$1,745

All monitors are EPA Energy Star™ and MPR-II certified. *Aperture Grille Free VMA-1 Mac cable adapter available.

With high fidelity speakers integrated into the bezel for directed stereo sound, a built-in microphone*, headphone jack, as well as mute and volume controls, these *award-winning* monitors offer a unique experience in sight and sound.

The ultimate in high performance monitors, the ViewSonic GT770 and GT800 blend aperture grille mask technology and the vertically flat SonicTron™ screen to produce the sharpest, most brilliant colors from center to corner. The high contrast images are the richest and brightest available today.

Our monitors are backed by a limited 3-year warranty on CRT, parts and labor... the best in the business. Plus your company can take advantage of our special 48-hour Express Exchange℠ Service option.

ViewSonic®

At ViewSonic, we make more than just good business monitors. We make good business sense.

A look at HTTP version 1.1, a necessary new Internet standard. ***By William Stallings***

The Backbone of the Web

The Hypertext Transfer Protocol is the foundation protocol of the World Wide Web. The name is somewhat misleading. HTTP is not a protocol for transferring hypertext; it is a protocol for transmitting information with the efficiency necessary to make hypertext jumps. The data transferred by the protocol can be plain text, hypertext, audio, images, or any Internet-accessible information. Information in this article is based on the most recent (June 7, 1996) specification—HTTP 1.1, draft 05—which has been forwarded to the Internet Engineering Standards Group as a proposed standard.

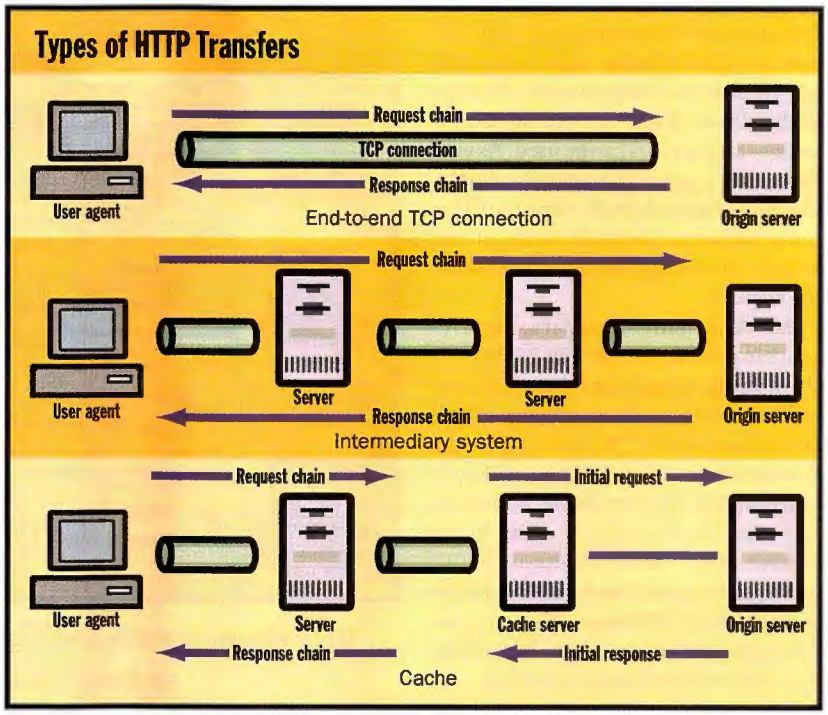
HTTP is a transaction-oriented client/server protocol. To ensure reliability, HTTP uses TCP. Nevertheless, HTTP is a "stateless" protocol: It treats each transaction independently. A typical implementation will create a new TCP connection between client and server for each transaction, then terminate the connection as soon as the transaction completes. However, the specification does not require this one-to-one relationship between transaction and connection lifetimes; i.e., the connection can stay open so that more transactions can be made.

The stateless nature of HTTP is well-suited to its typical application. A normal Web session involves retrieving a sequence of pages and documents. The sequence is, ideally, performed rapidly, and the locations of the various pages and documents may be widely distributed among a number of servers, located across the country or around the globe.

The figure "Types of HTTP Transfers" illustrates three examples of HTTP operations. The user agent is the client, such as a Web browser, that initiates the request. The origin server is the server on which a resource resides; an example is a Web server where a desired home page is located. The simplest case is one in which a user agent establishes a direct connection with an origin server. The client opens a TCP connection that is end-to-end between the client and the server. The client then issues an HTTP request. The request consists of a specific command (referred to as *a method*), a URL, and a message containing request parameters, information about the client, and perhaps additional content information.

When the server receives the request, it attempts to perform the requested action and then returns an HTTP response. The response includes status information, a success/error code, and a message containing information about the server, information about the response itself, and possible body content. The TCP connection is then closed.

The middle section of the figure shows a case in which there is not an end-to-end TCP connection between the user agent and the origin server. Instead, there are one or more intermediary systems with TCP connections between logically adjacent systems. Each intermediary system acts as a relay, so that a request initiated by the client is relayed through the intermediary systems to the server, and the response from the server is relayed back to the client.



HTTP supports operations via direct connection, intermediary systems, or a cache.

The Machine in the Middle

The HTTP spec defines three forms of intermediary systems: proxy, gateway,

and tunnel (see the figure "Intermediary HTTP Systems"). A proxy acts on behalf of other clients and presents requests from other clients to a server. There are several scenarios that call for the use of a proxy. In one scenario, the proxy acts as an intermediary through a firewall. In this case, the server must authenticate itself to the firewall to set up a connection with the proxy. The proxy accepts responses after they have passed through the firewall. Another scenario involves handling different versions of HTTP. If the client and the server are running different versions of HTTP, then the proxy can implement both versions and perform the required mapping.

A gateway is a server that appears to the client as if it were an origin server. It acts on behalf of other servers that may not be able to communicate directly with a client. There are several scenarios in which servers can be used. As with the proxy, a gateway manages transfers through a firewall. In this case the client must authenticate itself to the proxy, which can then pass the request on to the server.

Another common scenario involves working with a non-HTTP server. Browsers have built into them the capability to contact servers that use protocols other than HTTP, such as FTP and Gopher servers. This multiprotocol capability can also be provided by a gateway.

A tunnel is simply a relay point between two TCP connections. HTTP messages are passed unchanged as if there were a single HTTP connection between user agent and origin server. Tunnels are used when there is an intermediary system between client and server, but it is not necessary for that system to understand the contents of messages.

Now let's take a look at another type of HTTP operation. A cache is a facility that stores previous requests and responses for handling new requests. If a new request arrives that uses the same stored request, then the cache can supply the stored response rather than access the resource indicated in the URL. The cache can operate on a client or on a server or on an intermediary system other than a tunnel. In the figure "Types of HTTP Transfers," a server has cached a request/response transaction, so a corresponding new request from the client need not travel the entire chain to the origin server; instead, the cache server handles it. Not all transactions can be cached, and a client or a server can dictate that a certain transaction may be cached only for a given amount of time.

HTTP Messages

HTTP messages comprise two types: request and response. A request message is sent by an agent to a server to initiate some action. A response message is returned by a server to an agent in response to a request. Some possible actions are:

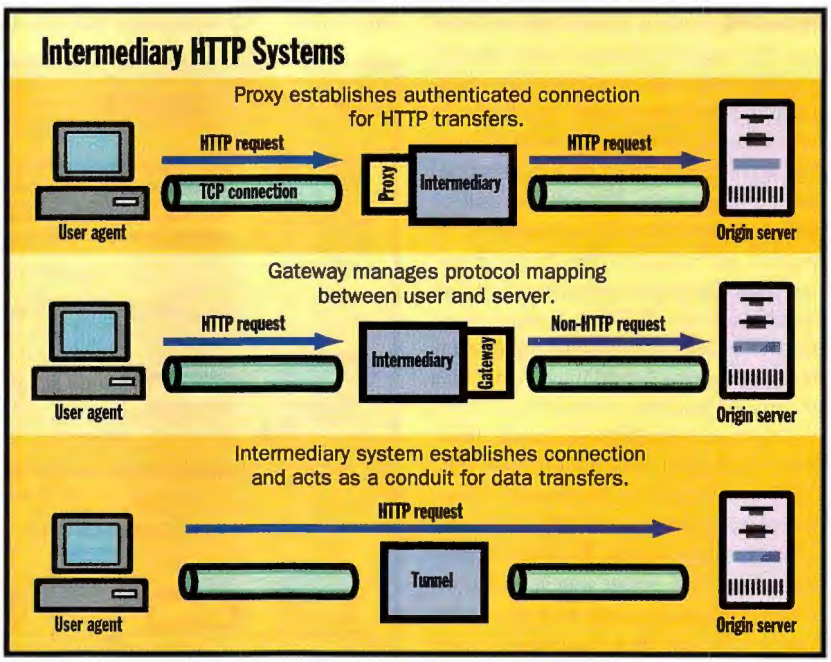
- GET: A request to retrieve information.
- POST: A request to accept the attached entity as a new subordinate to the identified URL.
- PUT: A request to accept the attached entity and store it under the supplied URL. This may be a new resource with a new URL, or it may be a replacement of the contents of an existing resource with an existing URL.
- DELETE: Requests that the origin server delete a resource.

A response message may include an entity body containing hypertext-based information. In addition, the response message must specify a status code, which indicates the action taken on the corresponding request. Status codes are organized into the following categories:

- Informational: The request has been received and processing continues. No entity body accompanies this response.
- Successful: The request was successfully received, understood, and accepted.
- Redirection: Further action is required to complete the request.
- Client error: Request contains a syntax error or request cannot be fulfilled.
- Server error: The server failed to fulfill an apparently valid request.

We Need This Standard

HTTP is the foundation of the World Wide Web. This request/response protocol used on top of TCP carries commands from browsers to servers and responses from servers back to browsers. As the explosive growth of the Web continues, and as new features are added to both browsers and servers, a standardized transfer protocol is essential to maintain the Web's growing functions and interoperability. HTTP provides the standardized definition required to meet these needs. B



HTTP allows requests and responses to pass through disparate systems that build the network.

William Stallings is a consultant and author of over a dozen books on data communications and networking. This article is based on material from his most recent book, Data and Computer Communications *(Prentice-Hall, 1996). You can reach him at* **ws@shore.net.**

Introducing the first handheld Windows PC that's tough enough for any occupation.

- 75MHz 486DX4 Processor
- 260MB Hard Drive
- Up to 32MB RAM
- 2 Type I, II, or III PCMCIA slots
- 1 Printer & 2 Serial ports
- Pen, Touch or Keyboard-based
- Temp: -10 to 50° C
- Shock: 20g (3-foot drop)
- Vibration: 2 G, 5-200 Hz
- Humidity: 5-95% R.H.
- Duracell Smart Battery
- Bundled: Windows, DOS, Pen Windows

You know the mobile PCs you're used to? Mama's boys, all of 'em.

Especially with the birth of the new Hardbody™ Handheld PC—the first full-featured 486 PC made for people with really tough jobs.

The Hardbody goes places that make other mobile PCs whimper in fear. It can take a punch. It laughs at heat, sunlight, cold, dust and rain. It scoffs at proprietary systems. It goes looking for trouble.

Yet the 3-pound Hardbody Handheld PC is a full-featured PC in every sense of the word. It runs off-the-shelf PC apps. It's completely networkable. And you can attach just about any piece of hardware or peripheral you'll ever need.

So if you've had your fill of cream-puff PCs, call Texas Micro or return the attached reply card today for more information, or to schedule a demonstration. And visit us at www.texmicro.com.

C O M P U T I N G W I T H O U T L I M I T S™

WANT A 486 UPGRADE THAT OUTPERFORMS INTEL? FOR $139 YOU CAN PUT KINGSTON INSIDE.

Making your 486 run like a Pentium® doesn't take magic. It just takes a TurboChip™ and a little pocket change. Instantly, you will have 5 x 86 clock-quadrupled technology that will help your system run three times faster. And the TurboChip has all the power you need to run today's demanding software, whether you have a 486-based DX2, DX, SX2, or SX system. So how does the TurboChip compare to Intel's OverDrive®? Not only does the TurboChip beat the OverDrive in price, compatibility, and warranty, but in a recent study* it also outperformed it. The TurboChip is designed with AMD's Am 5 x 86–P75 CPU and upgrades with most IBM-compatible desktop systems. And since the TurboChip is a chip-for-chip replacement upgrade, it's easy to install. Plus it preserves your system configuration. To find your nearest Kingston® distributor call us at (800) 251-9059, domestically or (714) 437-3334 for international sales.

RISC powers Intel's intelligent I/O controller for servers. ***By Tom Thompson***

The Server's Helper

The changing nature of information that office workers use has had an impact on the role the network server plays. Today's server must pump out digital video, audio, and 3-D graphics on demand; handle complex database queries; and manage Web transactions. As a consequence, a server requires a more efficient architecture than just a souped-up desktop-computer design. A faster processor and system bus aren't enough. The computer must manage the vast amounts of I/O this type of data demands. Radical architectures from Tandem and Sequent address this problem on high-end server designs, as described in "The Network in the Server" (July BYTE).

Moderate-size servers must also work with the same type of data, on a smaller scale. When it comes to handling I/O, such servers must work smarter, not harder. Even a multiprocessor server can grind to a halt if each processor is supervising a peripheral or—worse—waiting to access a congested system bus.

To this end, Intel just started sampling the i960 RP, a 32-bit RISC processor that functions as an intelligent I/O controller. It supports DMA transfers, address translation, various memory types, and multiprocessor interrupt control. Thus, it can manage most of a server's peripheral I/O traffic without CPU intervention, eliminating many throughput bottlenecks.

The i960 RP also acts as a PCI-to-PCI bridge unit, which lets you add more slots to the design. At the same time, the bridge unit reduces the number of components required to build a server that uses state-of-the-art high-speed PCI peripherals. This enables a server to provide high throughput yet remain affordable.

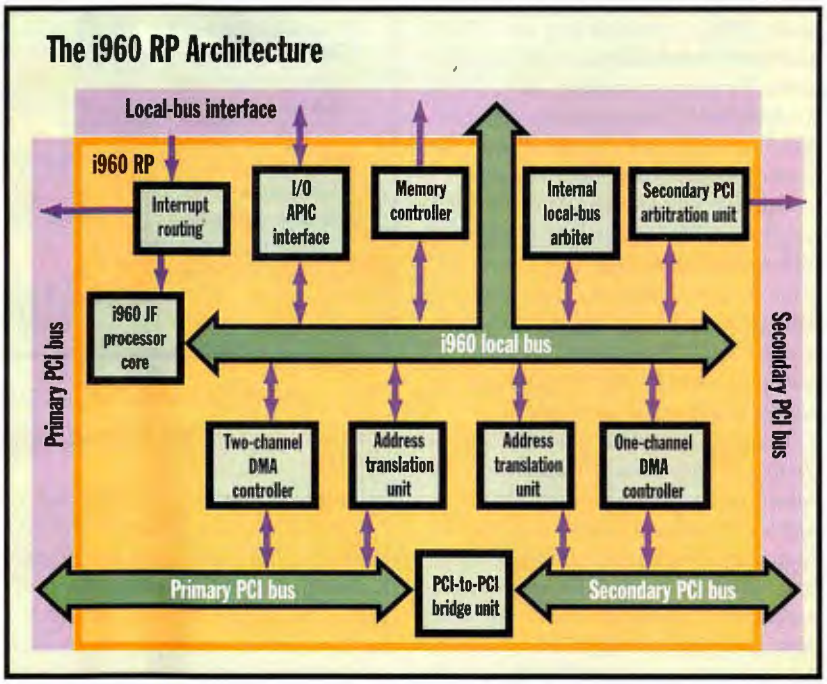
RISC at the Core

Like other chip vendors' smart I/O processors, Intel took the core of its tried-and-true i960 JF embedded processor and wrapped I/O support logic around it. Our tour of the processor begins with this RISC core. The i960 JF core consists of 32 32-bit registers. Sixteen of them are local (general-purpose); the other sixteen are global registers used for parameter passing or storing critical variables. An on-chip local-register cache stores up to eight copies of the local registers. This provides hardware support for the rapid entry and exit of function calls, a useful feature for time-critical interrupt handlers.

The core consists of 700,000 transistors and has a four-stage pipeline. It has several independent execution units (EUs): one for instruction processing and address generation, a multiply-divide-unit (MDU) for 32-bit math computations, and a memory interface unit that handles load/store operations. The core can scoreboard individual registers, so the processor can execute certain instructions in parallel, or out of order, to maintain single-cycle instruction execution.

The core includes a 4-KB two-way set-associative instruction cache, a 1-KB direct-mapped data cache, and 1 KB of on-chip data RAM. You can enhance interrupt processing by locking sections of interrupt-handler code within the instruction cache and by storing a number of interrupt vectors in the on-chip memory. At 33 MHz, the core delivers 31 VAX MIPS.

A bus-control unit (BCU) supports 8-, 16-, and 32-bit memory addressing, plus big-endian and little-endian addressing



This intelligent I/O controller manages DMA transfers and memory timing. It also acts as a PCI-to-PCI bridge.

modes. This lets the i960 connect to a large variety of memory and peripherals. Up to eight sections of memory, each 512 MB in length, can be defined with different memory-width attributes. Regions of memory ranging in size from 4 KB to 4 GB can also be defined as cacheable (typically for program memory) and noncacheable (typically for I/O devices).

Device Interfaces

The i960 RP provides a wealth of device interfaces and control functions, such as a memory controller, DMA controller, and PCI-to-PCI bridge unit, as shown in the figure "The i960 RP Architecture." These features can be used to both simplify a server design and improve system throughput.

The built-in memory controller generates the appropriate timing and signals for three different RAM types: fast page-mode (FPM), extended data out (EDO), and burst extended data out (BEDO). The controller supports memory interleaving for FPM RAM. The controller also handles 8- or 32-bit-wide ROM, static-RAM (SRAM), and flash-memory devices.

The i960's integrated DMA controller has three DMA channels that perform high-speed transfers between PCI peripherals and local memory (i.e., memory directly managed by the memory controller). Each DMA channel has a hardware packing and unpacking unit that can handle unaligned data transfers.

The DMA controller also implements *chain descriptors*. A chain descriptor is a data block that describes a DMA transfer, such as the amount of data to move, the source and destination addresses, a control value, and a pointer to the next descriptor. The pointers let you link descriptors into a "chain" of operations that can gather scattered blocks of data and transfer them in one chunk to the destination. These chains can implement sophisticated data transfers, perhaps moving data from a hard drive into memory and then to a network device, as shown in the figure "An Intelligent I/O Operation." Such a chain can supervise this type of complex transfer without interrupting the host processor, unless an error occurs.

WHERE TO FIND

Intel Corp.
Santa Clara, CA
(800) 628-8686
fax: (503) 264-6835
http://www.intel.com/DESIGN/IIO

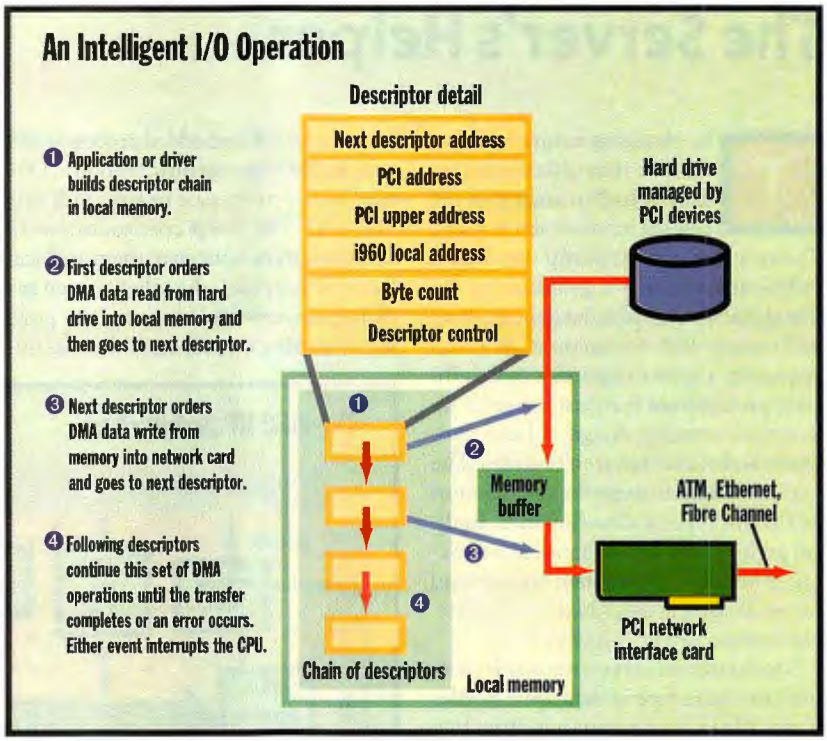
A Built-In Bridge

The most versatile feature of the i960 RP is its PCI-to-PCI bridging capability. It supports two PCI buses: a primary PCI bus, which connects to the host CPU, and a secondary PCI bus that's maintained by the i960. These interfaces let you add the i960 to a PCI-based server design without using additional glue logic. This secondary bus complies with the 5-V PCI standard, and at 33 MHz, it provides nine extra PCI loads. This lets the server design offer more PCI devices or card slots. You can attach additional i960 RP processors to the secondary bus to build a hierarchy of PCI buses, so that the system can handle a large number of network interfaces and storage devices.

The i960's PCI bridge logic can forward memory, I/O, and command transfers between the two PCI buses. However, you can program the bridge logic to "filter" certain PCI transactions. This reduces traffic in other buses on the server and aids in the implementation of intelligent I/O subsystems. For example, suppose a hard drive is streaming video data to an Ethernet interface, and both these PCI-based devices reside on the PCI secondary bus. The bridge logic blocks these transfers from the primary PCI bus, so that it can independently handle a different set of I/O operations.

The DMA controller works in tandem with the PCI-to-PCI bridge unit to boost throughput. Also, properly written descriptor chains can add smarts to low-cost PCI peripherals, so that their use improves performance while minimizing CPU overhead.

As you can see, the i960 RP offers many capabilities to a server design. Certain functions, such as the DMA controller, allow the systems designer to hand off data transfers between memory and peripherals to the i960, thus relieving the server's CPUs of this chore. Other functions, such as the memory controller and the PCI-to-PCI bridging capability, allow the engineer to eliminate some parts from the design, thus reducing the server's cost and complexity. B



Sequences of DMA commands can manage complex I/O transfers without CPU support.

Add an interactive database to your Web pages with a few simple tools. ***By Rick Dobson***

Make Access and the Web Work Together

Perhaps you've seen one of those cool Web pages where you type in a request to obtain up-to-the-minute product information. Microsoft's Internet Information Server (IIS), with its Internet Database Connector (IDC), simplifies the process of building dynamic Hypertext Markup Language (HTML) pages so that you can add such a mechanism into your Web pages. This lets you develop and maintain intranet and Internet Web sites that allow the interactive search, display, and modification of information in a Microsoft Access database.

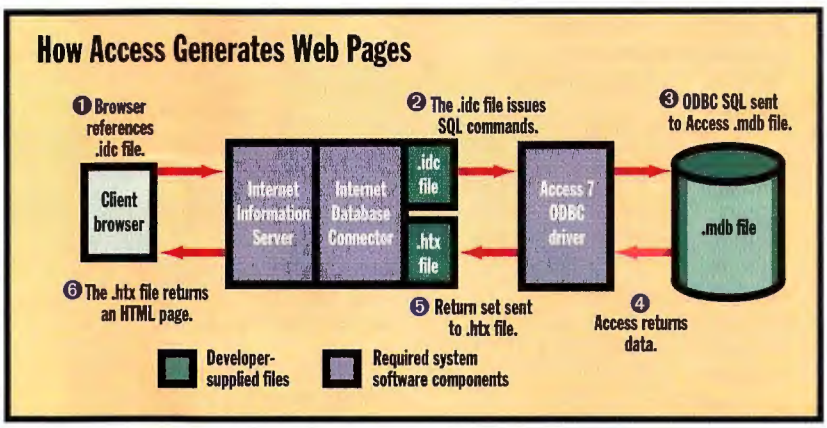
It's important to note that such applications can support only low to intermediate hit rates. However, it's easy to upsize them to full-blown SQL Server applications. Thus, Access shines as a rapid prototyping tool for building frequently visited Internet sites.

This approach requires three items. First, Web-site visitors must have Web browsers. Second, the IIS/IDC must be running on the server. The IDC is a DLL named HTTPODBC.DLL. Third, you must install the Access 7 for Windows 95 Open Database Connectivity (ODBC) driver on the server. The IDC requires such a "thread-safe" ODBC driver so that multiple clients can launch concurrent queries against the same data source.

Dynamic Access Parts

The Web browser handles any user events and typed input, and it displays the information returned by the database. An .mdb file stores the tables, forms, queries, and modules that comprise your Access database. Two key developer-designed files on the IIS manage the interactive process, as shown in the figure "How Access Generates Web Pages." The .idc file defines specific valid data fields and operations; the .htx file formats the returned data for display by the client browser.

The key field in an .idc file is `SQLStatement`. It lets you perform all the functions permitted by Access's SQL. Two other required fields are `Datasource` and `Template`. `Datasource` ultimately points the query embedded in `SQLStatement` to the appropriate .mdb file. Finally, `Template` names the .htx file that's responsible for formatting the result.



The developer provides several files to create an interactive database connection on the Web.

You can include several optional fields that refine your application's behavior. `MaxRecords` designates the maximum number of records a query returns. With `DefaultParameters`, you can supply default criteria for a query when the client fails to do so. Use `RequiredParameters` instead to generate an error when the client browser does not provide a parameter. `Username` and `Password` act as a gateway to security features. These fields, in conjunction with Access's users, groups, and permissions features, can restrict admittance to tables with sensitive data, such as salaries.

The .htx file is a template for the HTML file passed back to the client Web browser from the IIS. The .htx file includes special tags for processing the query results returned by the ODBC driver. These vendor-specific tags, in conjunction with traditional HTML tags, let developers control what a client browser views.

A Sample Program

I constructed a simple database application based on the Northwind database sample that ships with Access. My test database includes two tables. The first, `tblCustomers`, contains the `CustomerID`, `CompanyName`, `ContactName`, and `Phone` fields. The second, `tblSalesByCustomer`, houses the `CustomerID` and `Sum` fields. `Sum` contains the total sales for each customer.

My initial .idc file (shown in the listing "Query Input and Control" on page 72) creates a listing of the top 10 customers ranked by sales in descending order. This file contains four fields. The first one, `Datasource`, points to the target .mdb file, as routed through an ODBC data source. The ODBC-driver dialog box has a New button that allows the developer to create the data source that points to the .mdb file. However, `Datasource`

eliminates this bit of manual intervention for the user, which is necessary to support a self-contained Web site.

The second field, `Template`, names an .htx file that serves as a template for formatting the HTML page to appear on the client's browser. The third field, `MaxRecords`, restricts the lists of returned records to 10. Finally, `SQLStatement` includes the SQL string that controls the query. Each line, including the first one, must begin with a plus sign.

An .htx file can contain all the graphic files and formatting touches that regularly adorn the HTML pages at your favorite Web sites. The .htx file displays the query results within a pair of `<%BeginDetail%>` and `<%EndDetail%>` vendor-specific tags. To display a particular query, bracket its name inside these vendor-specific tags (e.g., `<%Sum%>`). The IIS repeatedly merges all .idc fields between `<%BeginDetail%>` and `<%EndDetail%>` for each record in the return data set.

You create drill-down hyperlinks to other pages by use of HTML anchor tags. You do this by placing another .idc filename between the anchor tags, which in turn creates a drill-down page. A question mark must follow the .idc filename. This is demonstrated in the first listing's .htx file. When you need to pass a parameter to the second .idc file, insert a phrase such as `CustomerID=<%CustomerID%>` after the .idc filename. The left term, `CustomerID`, designates a field in `SQLStatement` for the second .idc file. The term that's on the right of the equal sign references the value in the current hyperlink.

The listing "Data Close Up" shows the .idc and .htx files that generate the drill-down page from the top 10 `CustomerID` displays. This .idc file extracts the company and contact names along with the phone number for the `CustomerID` that matches the one in the hyperlink jump. It accepts a passed argument with an expression such as `CustomerID=%CustomerID%` in the `Where` clause of its `SQLStatement`. The term on the left of the equal sign corresponds to a field in the `Select` list of the query. The term on the right of the equal sign represents the passed parameter. Its value is set by the calling hyperlink jump.

The .htx file in the listing "Data Close Up" demonstrates some basic HTML tag techniques for controlling the display of records returned by an .idc file. Its corresponding .idc file returns a single record with four fields. The `BR` tag positions each field on a different line. The other tags adjust the font and the position of the results.

Closing Issues

The IIS/IDC plus Access provides a quick, easy way to start publishing dynamic HTML pages from a database. Many more options beyond those in the code listings are feasible. For example, you can populate combo boxes on HTML forms, or you can accept values directly from HTML forms for selecting or updating an Access database.

I found the new functionality easy to use, but experienced Access developers will appreciate enhancements. First, Access developers are used to more flexibility in processing return sets than the .htx file permits. Among the features missing are event programming and expressions. Second, no error-trapping techniques are available with this release. While errors do not cause the system to abruptly halt without user recovery, you can still be confronted with error messages that may not be meaningful. Third, wizards and more graphical development aids would help promote the acceptance of this Web development strategy among Access developers. B

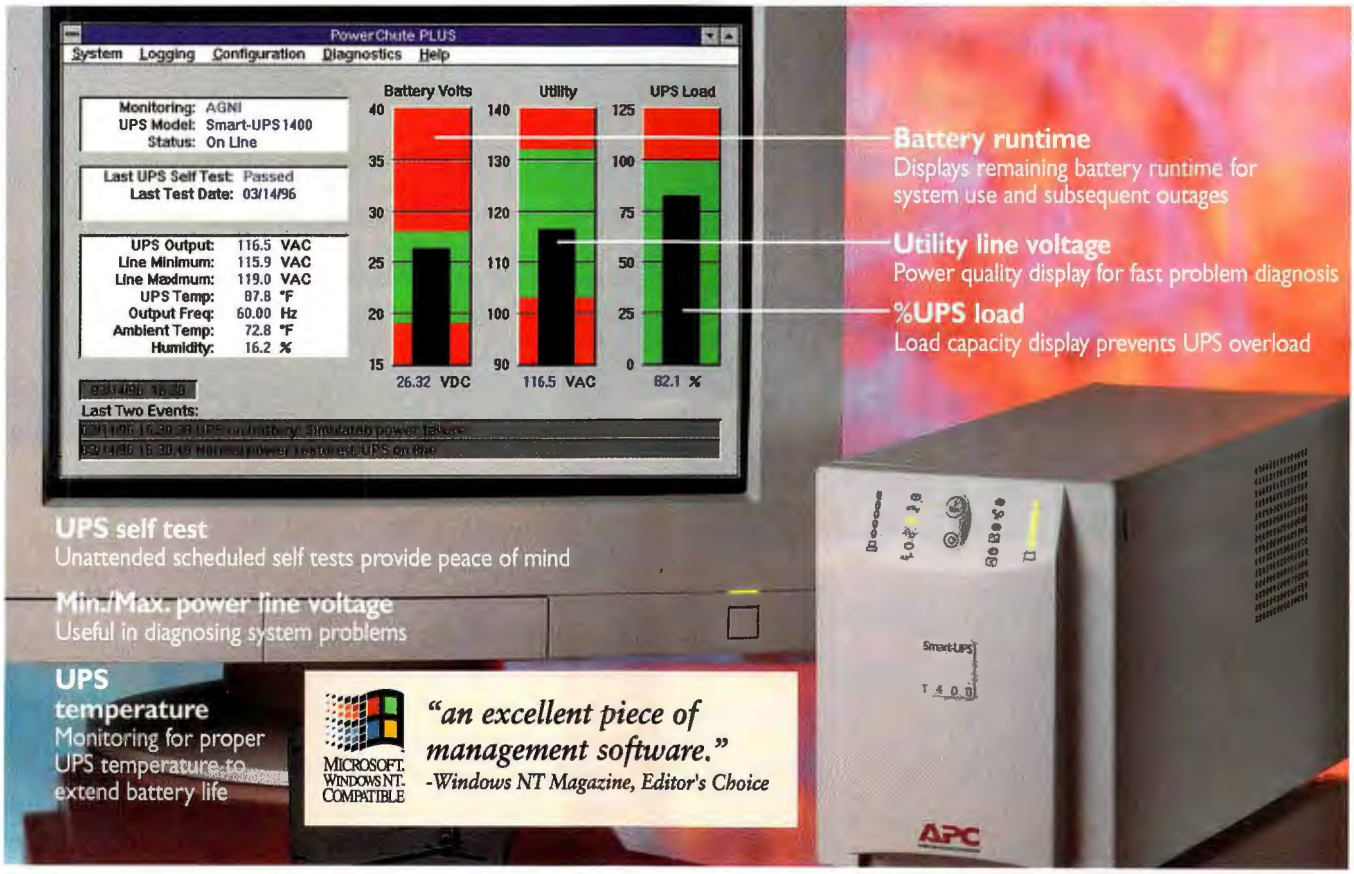
TOTAL POWER SOLUTIONS

Introducing bulletproof glass for Windows™ NT networks



Protect ME! APC

According to Microsoft, "A UPS is an important part of any deployment of Windows NT systems..." Fortunately, APC provides the most comprehensive protection against the single largest cause of NT data loss—power problems. APC's PowerChute® *plus* for Windows NT and APC Smart-UPS combine to give you the power management features necessary to make SURE you're protected.

- **Shut down system safely**-graceful, unattended shutdown of Win NT & SMS Servers. Through scheduled shutdowns you can even cut energy costs by up to 76%.
- **UPS testing/status**-assures that system administrators are informed of power problems *before* they impact system integrity.
- **Remote UPS management**-eliminates the need to send trained personnel to remote sites to configure UPS parameters, reboot servers or diagnose power problems.
- **Environmental/power monitoring**-allows you to quickly diagnose power problems and thus decrease network downtime without the expense of an electrician.

PowerChute *plus* also provides:

- **NEW FlexEvents**-Want to be paged or have an E-Mail sent to you if there is a power problem? FlexEvents allows you to specify these and other customizable UPS reactions to power events.
- **Systems Management Servers UPS MIF Support** permits asset management of UPS systems.

"The Smart-UPS not only cuts the leading edge of power protection, its PowerChute plus software also delivers full management and control...[with] the best combination...of new and innovative features." **-Network Computing**

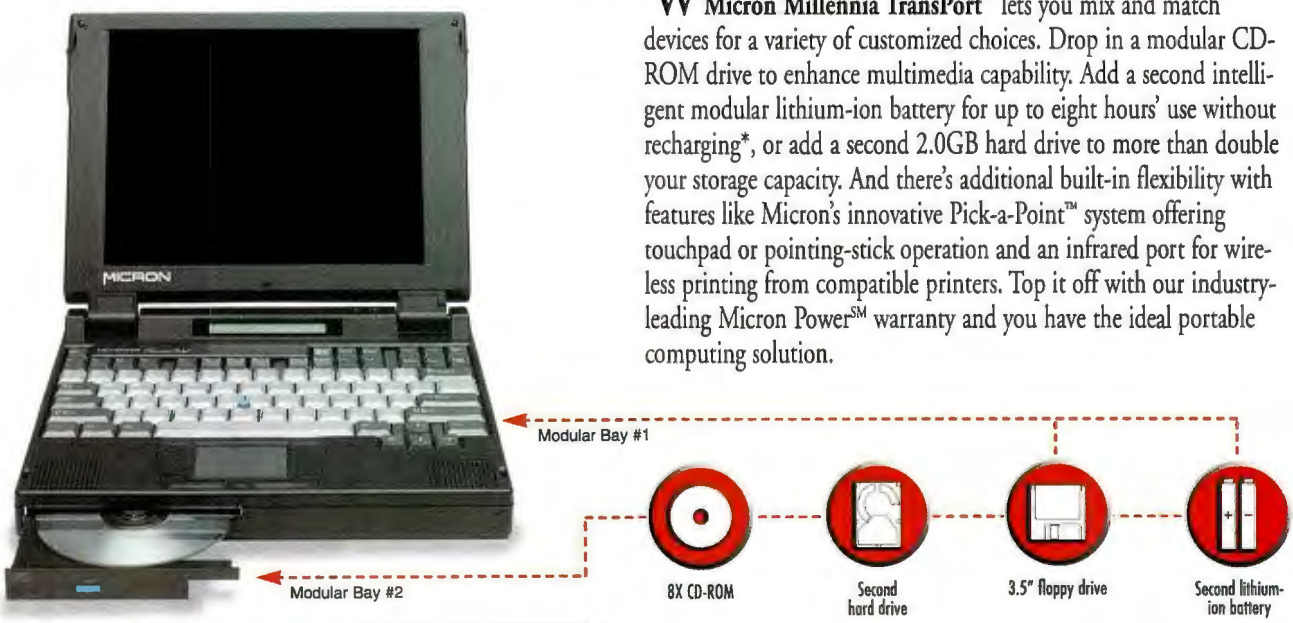
WHEN YOU NEED THE POWER OF A DESKTOP AT 30,000 FEET, MICRON HAS YOU COVERED.

With up to eight hours' battery life* and full multimedia desktop performance, the Millennia TransPort™ puts compact, no-compromise computing where you need it.

With its exclusive FlexOpt™ dual bay modular design, the **Micron Millennia TransPort™** lets you mix and match devices for a variety of customized choices. Drop in a modular CD-ROM drive to enhance multimedia capability. Add a second intelligent modular lithium-ion battery for up to eight hours' use without recharging*, or add a second 2.0GB hard drive to more than double your storage capacity. And there's additional built-in flexibility with features like Micron's innovative Pick-a-Point™ system offering touchpad or pointing-stick operation and an infrared port for wireless printing from compatible printers. Top it off with our industry-leading Micron Power℠ warranty and you have the ideal portable computing solution.



PC MAGAZINE EDITORS' CHOICE

AUGUST 1996
MILLENNIA TRANSPORT P133

Already a winner of two *PC Magazine* Editors' Choice awards for Millennia™ products, Micron just won a third with our Millennia TransPort™ in the August 1996 edition of *PC Magazine*.

Micron Power℠ Warranty & Support

- 5-year limited warranty on microprocessor and main memory
- 3-year limited parts-only system warranty
- 1-,2- or 3-year optional on-site service agreement for Micron desktop systems
- 30 days of free Micron-supplied software support for Micron desktop systems
- 30-day money-back policy
- 24-hour technical support

The foregoing is subject to and qualified by Micron's standard limited warranties and terms and conditions of sale. Terms and conditions of sale my vary for specific configurations. Copies of the limited warranties may be obtained on our Web site or by calling Micron.

*Actual battery performance will vary depending on applications and configurations. Based on two 4-hour batteries.

Millennia TransPort™ P133

- 16MB EDO memory (48MB max.)
- 12.1" active matrix color display, 800 x 600
- 1.2GB removable hard drive

$4,399

Business lease $150/month

- 32MB EDO memory (48MB max.)
- Motorola® Montana 28.8 fax/modem
- 12.1" active matrix color display, 800 x 600
- 1.2GB removable hard drive
- 2nd lithium-ion battery

$5,199

Business lease $163/month

Options:

- With 150MHz Pentium processor ..... add $200
- With 2nd 1.2GB removable hard drive ..... add $599
- With 2nd 2.0GB removable hard drive ..... add $699
- With 16MB DIMM module upgrade ..... add $349
- With 3Com® IDBT PCMCIA ..... add $149

Standard Features

- 133MHz Mobile Intel Pentium® processor
- Intel 430MX PCI chipset
- 256KB L2 pipeline burst cache
- 16MB EDO memory (48MB max.)
- 8X modular CD-ROM drive
- PCI graphics accelerator, 1MB EDO memory
- Pick-a-Point™ dual pointing devices integrate both pointing stick and touchpad
- Removable EIDE hard drive (1.2GB max.)
- 3.5" modular floppy drive
- Intelligent modular lithium-ion battery
- 16-bit stereo sound
- Built-in stereo speakers and microphone
- 2 Type II or one Type III PCMCIA slots
- S-Video and NTSC video-outputs
- Headphone, microphone and line-in jacks
- 2 infrared ports: one front, one back
- Parallel, serial, VGA and 2 PS/2 ports
- Dimensions: 11.7" x 9.4" x 2.0", Weight: 6.9 lbs.†
- Nylon carrying case
- Microsoft® Windows® 95 and MS® Plus! CD
- Microsoft Office Pro 95 and Bookshelf® 95 CDs
- Kensington™ security lock‡
- 5-year/3-year Micron Power℠ limited warranty*

† 6.9 lbs. includes 3.5" floppy and one battery
‡ Lock secures both Millennia TransPort and MiconDock™

3-D for EVERYONE

Seeing isn't believing: 3-D must face growing pains before it can become essential for business applications.

By Udo Flohr

Now that low-cost 3-D is reaching our desktops at little or no extra cost, cynics might respond with a resounding, "So what?" They counter that, unless you're hooked on shoot-'em-up games, low-cost 3-D is just another check-off item from board vendors vying for your business.

But proponents counter that 3-D's potential for general-purpose computing is wide open. Just as GUIs and the mouse changed the face of computing during the past decade, 3-D will bring about new ways of viewing and analyzing data.

Timing puts the truth somewhere between these two opposing views. Innovators at places such as Xerox's Palo Alto Research Center (PARC) are already showing early software designs that use 3-D to add layers of information to databases and interfaces, making today's 2-D software look Spartan by comparison. But commercial versions of these products are at least a year or two from widespread use.

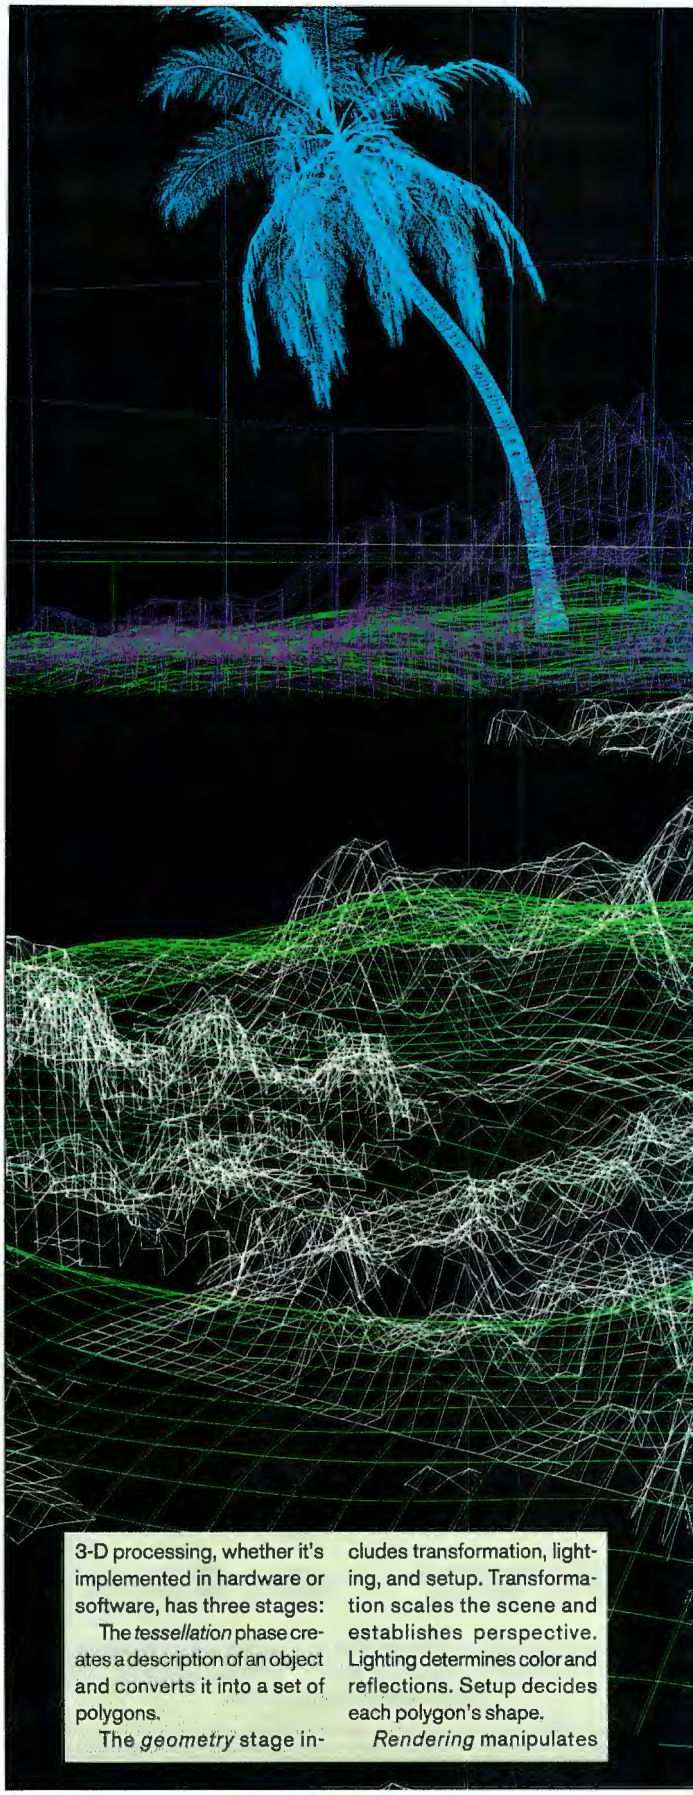
In the meantime, buyers beware: Not all the chips, boards, and APIs that spawned this year's crop of low-cost 3-D products will have the ability to run tomorrow's applications. To keep their designs affordable, vendors of low-end 3-D products made some compromises. As a result, some game-optimized chips cannot provide the processing power that professional-level 3-D accelerators now deliver for simulations and CAD applications.

The bottom line is that today's low-cost 3-D world is neither insignificant nor fully formed. This situation forces us to look beyond the glittering graphics to make judicious choices about 3-D.

Real 3-D

How might 3-D eventually change the way in which we work? The first phase of mass-market 3-D products will bring traditional 3-D applications, such as architectural walk-throughs, virtual reality, animation, and state-of-the-art games, to mainstream desktops. Next we'll see 3-D applied to standard applications, such as graphics editors, spreadsheets, and even word processors.

continued

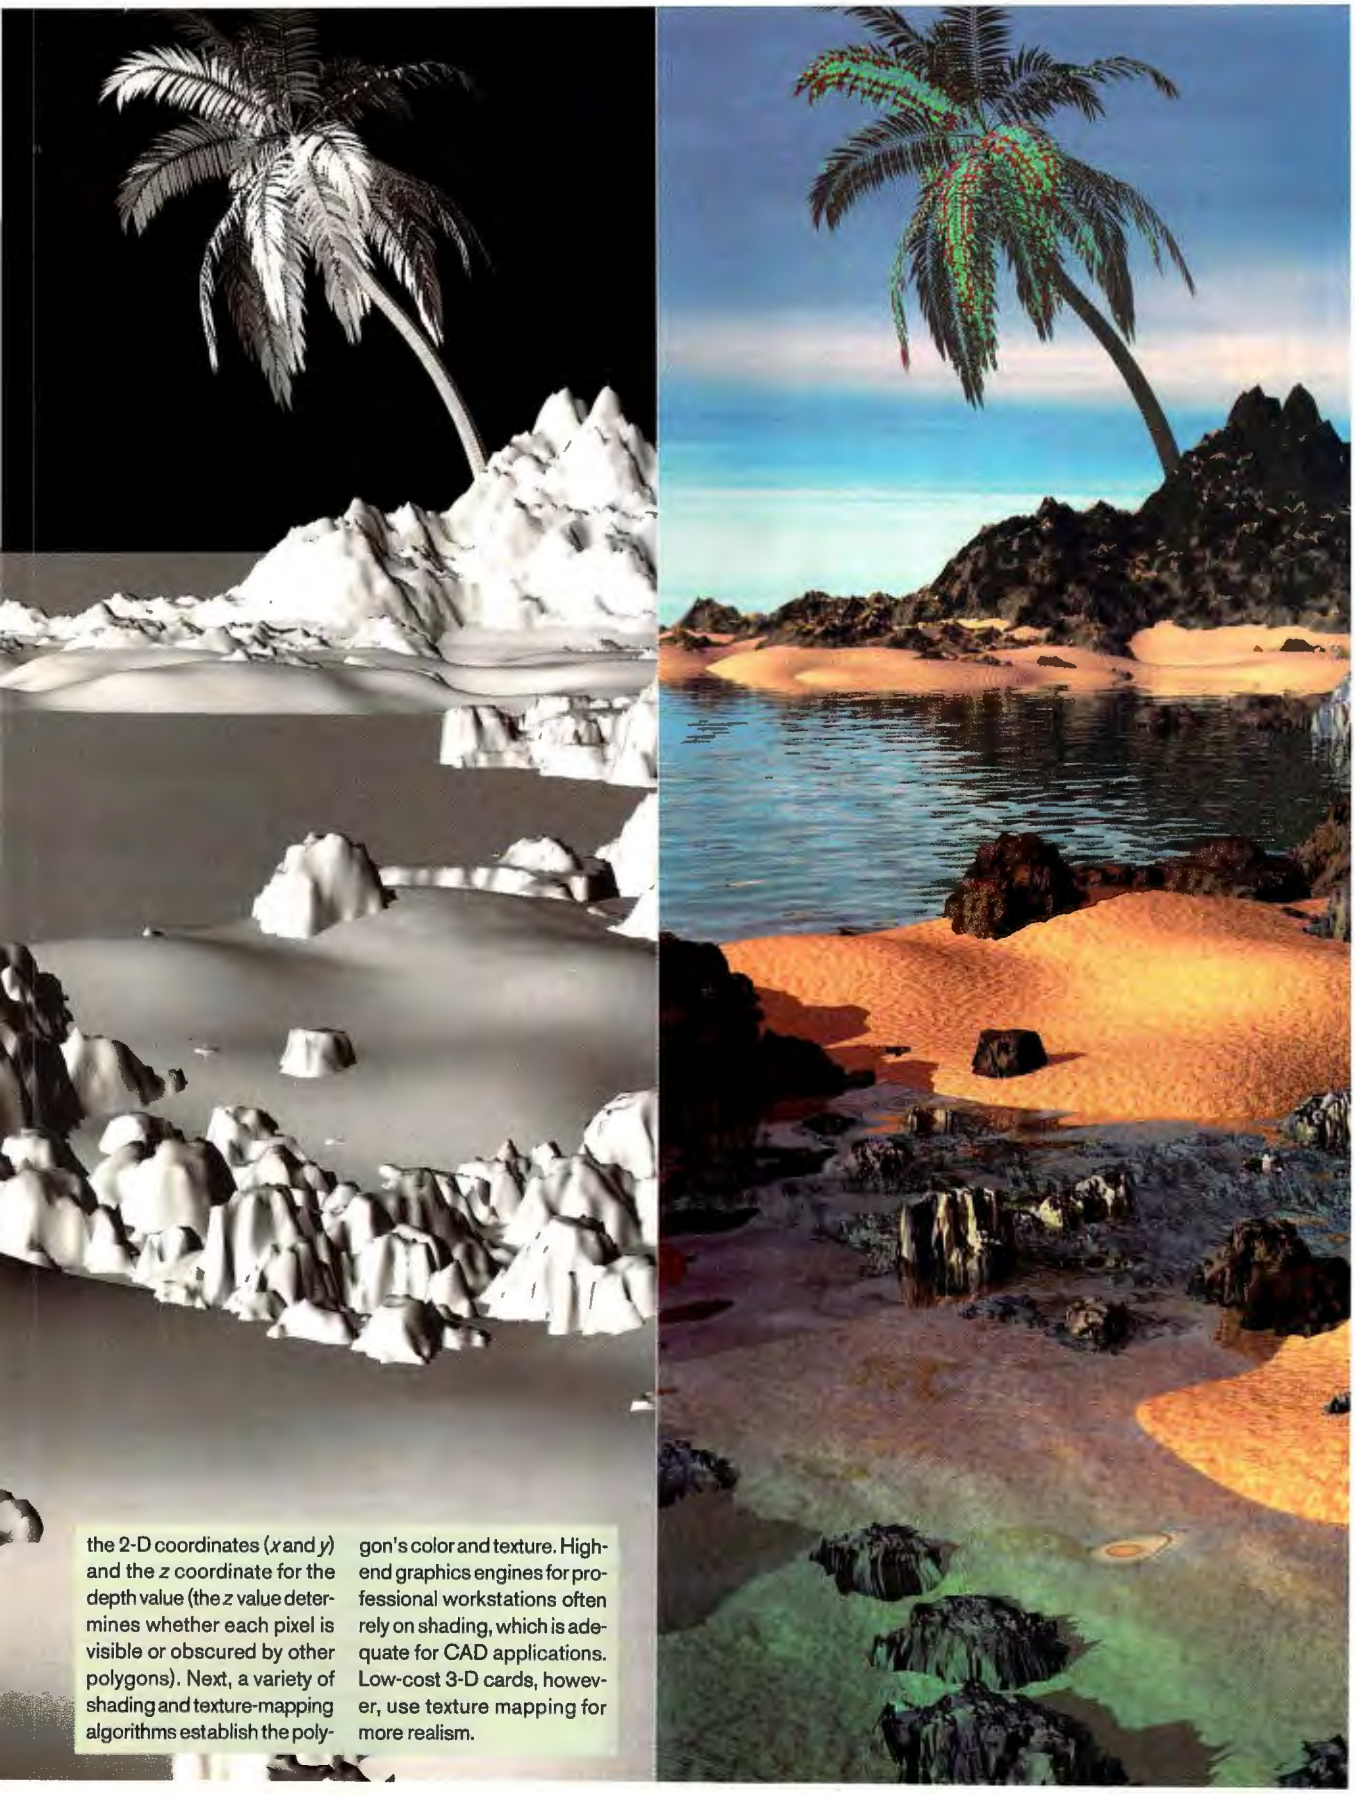


3-D processing, whether it's implemented in hardware or software, has three stages:

The *tessellation* phase creates a description of an object and converts it into a set of polygons.

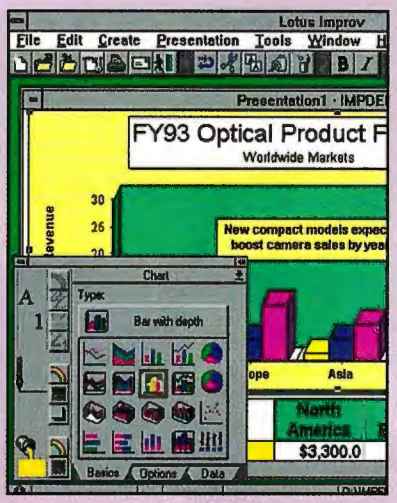
The *geometry* stage includes transformation, lighting, and setup. Transformation scales the scene and establishes perspective. Lighting determines color and reflections. Setup decides each polygon's shape.

Rendering manipulates



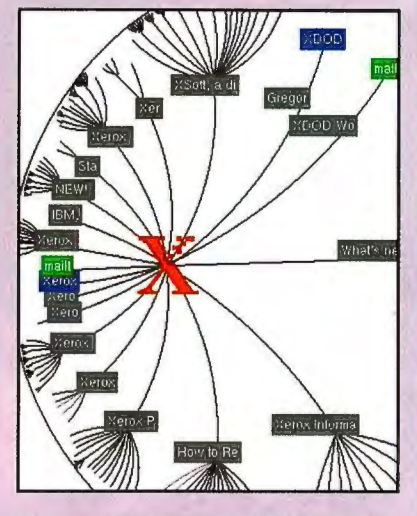
the 2-D coordinates (*x* and *y*) and the *z* coordinate for the depth value (the *z* value determines whether each pixel is visible or obscured by other polygons). Next, a variety of shading and texture-mapping algorithms establish the polygon's color and texture. High-end graphics engines for professional workstations often rely on shading, which is adequate for CAD applications. Low-cost 3-D cards, however, use texture mapping for more realism.

3-D Evolution



In the past, spreadsheets used visual tricks to simulate the 3-D experience. But you actually saw and manipulated data in 2-D space.

Competition is prompting games developers to actively devote resources to 3-D and to wade through problems caused by still-evolving API standards.



This hyperbolic view of a Web site, created at Xerox PARC, lets you browse a graphical map. It could be adapted for the 3-D browsing of hierarchical data structures.

To see the 3-D possibilities for general business applications, consider the advanced spreadsheets and databases that already work in three dimensions. Today you can populate a structural cube with data and then slice and dice it horizontally, vertically, or across a 3-D plane.

For instance, you might set up a 3-D spreadsheet to hold a year's worth of sales data, with each 2-D sheet listing the sales of a number of products for one month. Each layer of the spreadsheet holds information for a different month. To view the annual sales of a single product, you simply cut across the cube to retrieve the product's data for all 12 months.

The problem with this approach lies in viewing such a data cube on a flat surface. Once you cut across the cube, today's 3-D spreadsheets simply build a new 2-D view. Developers have tried to simulate the 3-D experience by adding slick interface tricks, such as drilling down on data by double-clicking on a functional heading or displaying the data within complicated 2-D matrices.

But in the end, 3-D spreadsheets have not met their potential because of the inherent weaknesses of working with 3-D data in 2-D space. In a true 3-D environment, you will be able to not only build a data cube but also rotate the cube in 3-D space and arrange the data in enlightening new ways.

Before that happens, we may see many examples of gratuitous 3-D. Developers and marketing wizards will concoct spinning logos and other graphical gimmicks, eye-catchers with little or no real value. But user-interface (UI) design is evolving to grasp 3-D's potential and turn it into something useful.

Whether or not software developers quickly turn 3-D into something that is useful for business applications, there is no doubt that ubiquitous 3-D is on the way. Consider Intel's MMX technology. MMX adds 57 new instructions to the x86 instruction set to accelerate multimedia applications, such as 3-D and 2-D graphics, video, audio, speech synthesis and recognition, and communications. According to Intel's simulations, we can expect to see performance boosts of between 50 percent and 100 percent.

MMX is slated to appear first in a new version of the Pentium processor, code-named the P55C, which is due early next year. Look for MMX support in APIs such as OpenGL and DirectX. (For an in-depth look at MMX technology, see the text box "MMX Accelerates the x86 " on page 79.) AMD and Cyrix are both planning to support MMX instructions in their future microprocessors.

There are various ways to distribute 3-D tasks between the CPU and the graphics chip. Graphics boards work with integer values; therefore, at the very least, the CPU must translate an application's floating-point values into integers.

Most often, the graphics chip works as a rendering engine, while *tessellation* (breaking up a 2-D image into polygons) and *geometry* (adding lighting and perspective) are left to the PC. For the third processing step, *rendering* (adding surface characteristics), low-cost 3-D boards often economize by combining frame, texture, and *z-buffers* (stored depth values) and allocating memory dynamically.

For example, if an application doesn't need a z-buffer (many games do not), the available memory can be used for the texture or frame buffer. Many applications set up the frame buffer in main memory, which is a mixed blessing: This approach saves cost by requiring less memory on the card, but it introduces a major bottleneck, as hidden surface removal has to be done across the PCI bus.

The majority of high-end 3-D accelerators employ separate buffers for frame, texture, and depth information, with each buffer having a capacity of at least 2 MB.

http://www.byte.com/

What can you do with 3-D besides play games? To find out, join BYTE editors and 3-D chip designers in an on-line discussion from October 21 through 25.

MMX Accelerates the x86

To improve multimedia and 3-D processing, Intel's new MMX technology can pack multiple pixels into one register and manipulate them with a single instruction. In effect, MMX brings a new level of parallelism to x86 processors.

Instead of adding new physical registers to the x86 architecture (which would slow MMX's adoption), Intel reuses the existing floating-point (FP) stack as logical MMX registers. MMX instructions use only the 64-bit mantissa portion of the 80-bit FP registers, ignoring the 16-bit exponent portion. This yields eight 64-bit logical registers without significantly altering the x86 architecture.

MMX instructions can pack several data types into these 64-bit registers: packed bytes (eight per register), packed words (four per register), packed doublewords (two per register), and a quadword (one 64-bit value per register). These data types are useful because multimedia programs typically work on small units of data. For example, a color pixel in TrueColor mode, the highest commonly used color resolution, uses 24 bits: 1 byte for each RGB color. This mode allows up to 16.7 million colors, more than the human eye can discern. In HiColor mode, only 16 bits are needed for a pixel. For many graphics applications, 16 bits is more than enough.

New x86 processors that support MMX will address the new registers as MM0 through MM7. Instead of treating the registers as a stack–as FP instructions do–MMX instructions can access the registers directly. When switching back and forth between FP and MMX instructions, the existing FSAV instruction saves the state of the registers, and the usual FRSTR instruction restores the values. This keeps MMX technology compatible with existing OSes, which frequently must save and restore the registers when context-switching between multitasking applications.

The downside is that programmers can't mix FP and MMX instructions together because they need the same registers. But this is not as significant as it sounds, since multimedia programs typically perform their FP operations before displaying the data. (Rendering relies more heavily on integer instructions.)

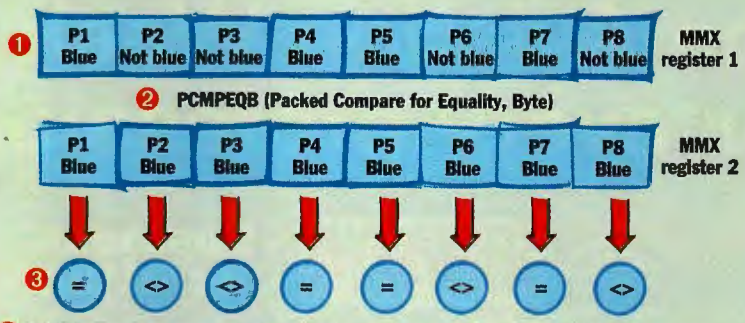
MMX introduces a set of general-purpose integer instructions that use the single instruction/multiple data (SIMD) paradigm. One instruction processes the multiple data in the packed registers. This parallelism increases performance. Incidentally, this concept is not new at Intel. Years ago, the now-obsolete i860 RISC family featured a similar technology, called Pixel Addressing Extension (PAX).

Another feature of the new instruction set, parallel-compare operations, could improve performance by eliminating branches. (Modern processors try to predict branches, but a misprediction means a penalty of several processor cycles.) Combined with packed data features, parallel-compare operations are useful when, for example, you want to combine or overlay two images.

The MMX instructions are similar to those in Sun's Visual Instruction Set (VIS) for the UltraSparc. VIS also packs registers and uses the FP registers. But it has a lot more to offer than MMX: 32 new registers (compared to Intel's eight), accelerated video decompression with discrete cosine transformations, more-powerful addressing modes, pixel masking, and a highly specialized set of operations that greatly accelerates motion estimation when compressing MPEG video streams.

MMX isn't Intel's only new approach to accelerating 3-D. Another new extension for 3-D accelerators is the Advanced Graphics Port (AGP). To evenly distribute main-processor tasks and graphics-chip tasks, the AGP creates a new data path for data transfers between main memory and the graphics card's frame buffer. By skipping the PCI bus altogether, AGP can theoretically allow read and write transfers at speeds up to 400 MBps, according to Intel.

Parallelism Speeds Performance



1. MMX instructions can pack 8-, 16-, 32-, or 64-bit values into the 64-bit MMX registers. Here, eight 8-bit graphics pixels are packed into a single register.
2. When an MMX instruction executes, all eight pixel values in each MMX register are processed simultaneously. (Here, the instruction compares pixels in registers 1 and 2 for equality.)
3. The results of the comparisons. The parallelism gained by having a single MMX instruction process multiple pixel values is faster than if separate instructions had to be issued for each comparison.

However, the cost of buffer memory alone keeps these products out of the mainstream market.

The 3-D Hardware Wave

Although 3-D accelerators divvy up processing tasks in similar ways, 3-D chip architectures can vary considerably. Some chips are programmable, such as Rendition's RISC-based Vérité and Chromatic's Mpact, which uses a very-long-instruction-word (VLIW) architecture. Two other programmable chips, the TM-1 from Philips and the Mfast from IBM, were not yet shipping at press time.

The performance of programmable 3-D chips depends to a large extent on the low-level software that drives them. Both Rendition and Chromatic currently supply such firmware. OEMs that write their own low-level software can enhance these processors with new features, data formats, or algorithms.

modules allow systems designers to enable or disable specific functions—such as 3-D graphics, videoconferencing, and telephony—to create a single hardware design with a number of different personalities. Unlike the Mpact, the Vérité was designed specifically for 3-D acceleration. It includes a hardwire "pixel pipeline" for critical 3-D operations, such as texture mapping and blending, while the RISC core is responsible for geometry setup and filtering; this relieves the CPU of the majority of the 3-D work load.

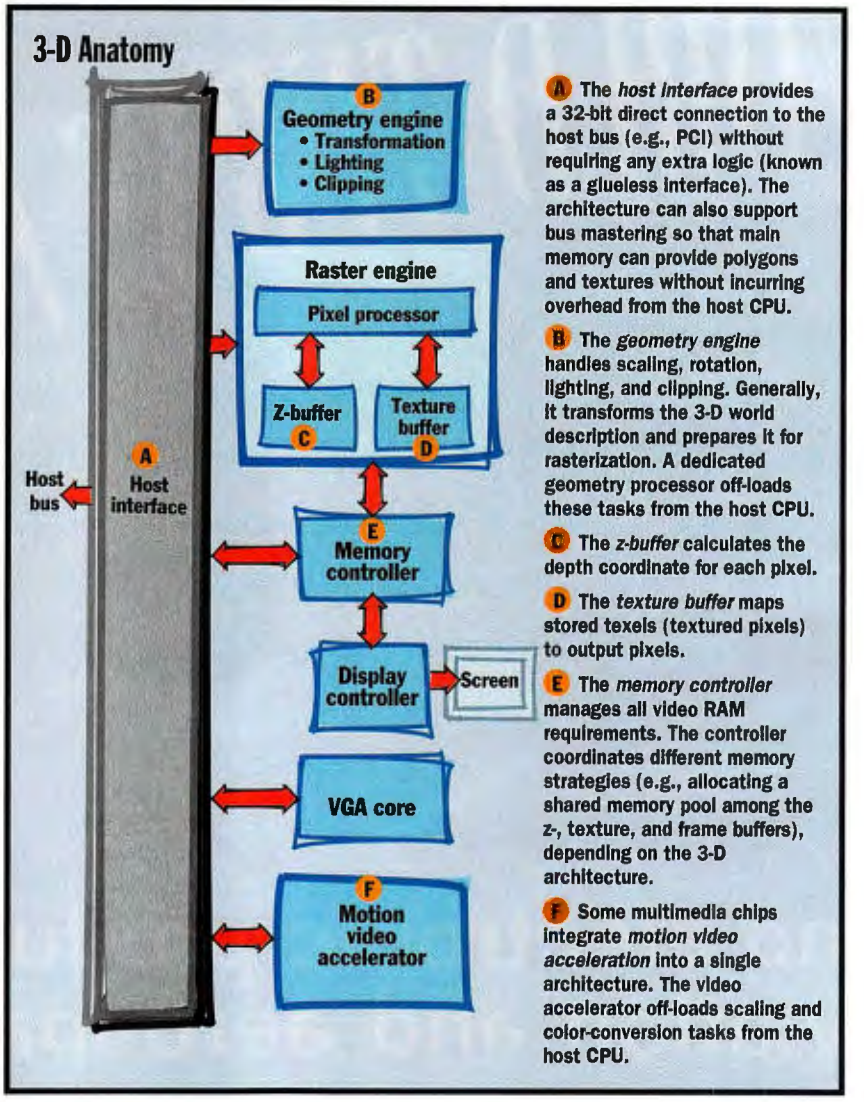
Hard-wired solutions, such as those from Nvidia, 3Dfx Interactive, and 3Dlabs, sacrifice this flexibility but often achieve higher performance. As APIs and other standards evolve, customers must depend on these vendors to update their designs quickly or, in some cases, to develop new software drivers to support the emerging standards.

Nvidia's NV1 requires additional developer support because of its proprietary curve primitive. Instead of building curved surfaces from small polygons, the NV1 generates curves directly to dramatically improve performance when an application requires textured curves. The drawback is that developers must port applications to the Nvidia chip before they can take advantage of these curve primitives.

Many of the graphics companies now offering low-cost 3-D chips and boards have been selling to the 2-D graphics market for years. They offer their customer base a terrific advantage: The new 3-D chips are pin-compatible with the previous generation, so the 3-D chips can slip into a proven card design. For example, the S3 Virge is pin-compatible with the popular S3 Trio64V+. On the downside, not all of these mainstream graphics vendors have the expertise of the established 3-D companies.

3Dfx is one of the few companies in the low-cost 3-D market with a strong 3-D résumé. The firm has made a business of replacing the expensive proprietary engines used in dedicated arcade machines with high-performance Pentiums. Focusing on this specialty, 3Dfx has designed a dedicated 3-D chip that delivers impressive 3-D acceleration but lacks integrated functionality, such as standard GUI acceleration and motion-video playback.

A dedicated 3-D solution does not replace a PC's graphics card; instead, it complements it with a "pixel pump" that works in parallel with the graphics accelerator that's on a separate PCI board. After the 3-D chip calculates the pixels, they pass across the PCI bus to the graphics card.



Like the 3Dfx Voodoo Graphics accelerator chip set, VideoLogic's PowerVR is a dedicated 3-D chip that requires an existing graphics accelerator. To compete with integrated solutions, 3Dfx has formed a partnership with Alliance semiconductor to combine the Voodoo with Alliance's ProMotion graphics controllers.

Bring on the Boards

Now that 3-D chips are appearing on commercial boards, we are seeing some 3-D warts along with the glitter. One particularly unpleasant surprise is that 3-D acceleration in many low-cost boards works only in one mode—namely, at a resolution of 640 by 480 pixels with 64,000 colors.

This is fine for play, since today's 3-D games don't require any more screen real estate than that. But this situation will eventually change. As more business applications use 3-D, 640 by 480 is becoming all but useless, and switching back and forth between resolutions quickly gets tedious. It's better to instead consider cards that accept additional memory to support 3-D acceleration at 800 by 600.

Many vendors bundle games with their 3-D boards. Some of these games use special features of that vendor's hardware; we've even heard of programs that use a high-level API, such as Microsoft's DirectX family of interfaces, and still use hardware references to stop users from switching horses. In addition, games developers are fond of squeezing every last bit of performance out of the hardware.

Since the jury is still out on how much of a performance penalty the multiple software layers in Microsoft's 3-D APIs will inflict, some people might be tempted to

An AS/400® Advanced Series Solution

He also found that making his software available on AS/400 Advanced Series gives both him and his customers a flexible and affordable way to grow.

and a network of 3,000 resellers who keep the numbers rolling in.

is SourceMate's versatile software that 80,000 customers count on

Behind Ben Tse's success in capitalizing on the small business market

As cofounder of SourceMate® Information Systems, Ben Tse has a remarkable head for numbers (as well as the suit to match). So, to keep his numbers headed in the right direction, Ben figured he'd give his customers a way to grow with him. His solution: AS/400 Advanced Series.

For as little as $180 a month, Ben financed an AS/400 Advanced Series. Using Win400™ for Clipper,™ he was able to port his AccountMate® accounting software, opening new avenues for growth. His 3,000 resellers are able to offer small businesses, worldwide, an incredibly scalable computing system. And his customers are able to grow their business, without changing their software.*

Best of all, as an IBM partner, Ben received the technical and financial support he needed along the way.

On balance, it was just the kind of affordable solution Ben, his VARs and his customers were looking for.

How can your company profit from AS/400 Advanced Series' 360,000 systems, worldwide? Call 1 800 365-4426, ext. 630, or visit us on the Net at www.as400.ibm.com and we'll show you a number of ways.

IBM®

Solutions for a small planet™

*Developers Lease available from IBM Credit for commercial, state and local government customers qualified as Independent Software Developers financing an AS/400 Advanced Server Model 40S. Payments as low as $180.00 per month for best credit customers on a 24-month fair market value lease. Other rates, terms and conditions are available for non-qualifying software developers or developers with different credit qualifications, or other commercial or state and local government customers. Credit and other restrictions may apply. Advanced Server must be installed by December 31, 1996. SourceMate and AccountMate are trademarks of SourceMate Information Systems, Inc. Alpha blending, Dithering, Double-buffering, Filtering (point-sampled, bilinear), Graphics primitives (points, lines, triangles), MIP mapping, PCI interface (glueless), Perspective correction, Rastering, Shading (flat, Gouraud), Textures

✔ = yes.

bypass them. In the long run, only hardware and software that supports the relevant APIs will survive. Until then, shoppers should select a board that has all the drivers needed for it to perform with the software they expect to use.

If you have a high-performance graphics board and just want 3-D acceleration, then something like VideoLogic's PowerVR, working in parallel with the main graphics board on a separate PCI card, could be an ideal solution.

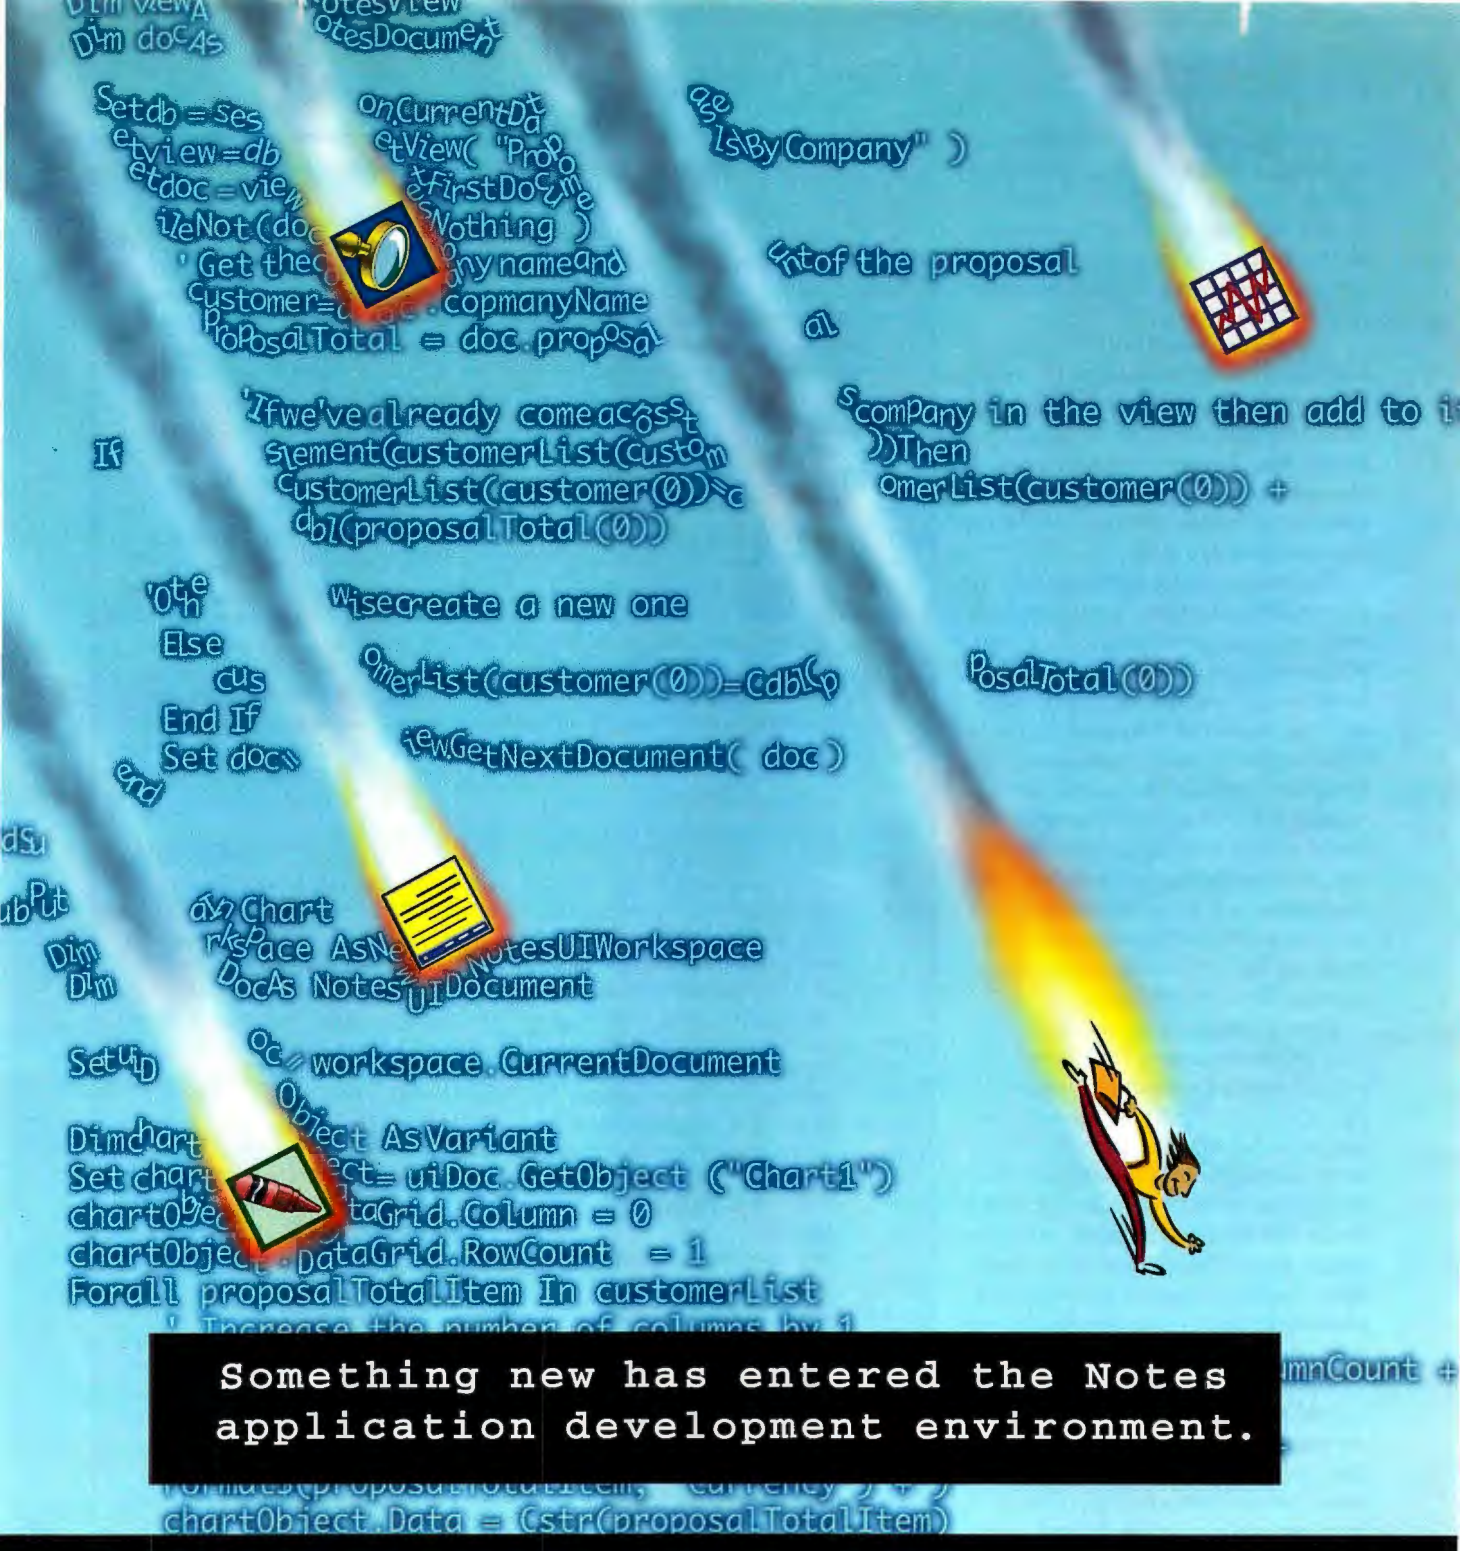
Nonstandard 3-D

Currently there are about 50 APIs for 3-D. This situation is not conducive to matching the hardware flood with the ground swell of cool mass-market applications.

APIs—the libraries of boilerplate routines that define standard sets of graphics functions—give programmers "hooks" into an otherwise-closed environment, such as an OS, a database, or hardware drivers. In the 3-D arena, APIs also function as an isolating layer to protect applications programmers from the idiosyncrasies of proprietary hardware. *continued*

3-D Glossary

- **Alpha blending:** Support for true object transparency in hardware. An alpha value defines the transparency of each pixel. The accelerator takes this transparency value into account when drawing objects, perhaps by blurring an object when it passes behind a transparent object or changing the color of a transparent foreground object to match that of a background object.
- **Antialiasing:** An antialiasing algorithm will slightly blur diagonal lines and other effects to better simulate a smooth line.
- **Atmospheric effects** (fogging and depth cueing)**:** Fogging creates a haze over a scene. Depth cueing changes the color and hue of an object in accordance with the object's distance from the viewer.
- **Bilinear versus point-sampled filtering:** To interpolate pixels, some low-end 3-D algorithms take the nearest adjacent pixel (i.e., the nearest neighbor sampling) and replicate its color. Small on-screen movements can cause full pixels to change color, causing aliasing and unwanted screen artifacts. Bilinear filtering averages the 4 nearest texels (textured pixels) to interpolate a pixel, producing a higher-quality image.
- **MIP mapping:** When a texture is applied to an object, it often has to be resized or stretched to fit. This process degrades the texture image. MIP mapping creates three or more copies (called MIP *levels*) of the texture, each of a different size, so that the best-fitting copy can be used.
- **Perspective-correct texture mapping:** Texture maps that continually change to match the perspective of the viewer.
- **Subpixel positioning:** If a line does not run directly through a pixel, it must be moved to the nearest one, which introduces positional error. Pixels can be broken down into smaller subpixels in memory so that the line can be drawn to the nearest subpixel.
- **2-D and GUI acceleration:** If your 3-D accelerator also acts as your primary graphics card, make sure that it supports 2-D and GUI acceleration. Otherwise, the performance of your standard Windows applications will degrade noticeably.
- **Video acceleration:** If your applications include motion video, look for an accelerator that supports hardware video acceleration. Video acceleration performs color-space conversion and scaling in hardware, removing that chore from the host CPU and improving the quality of video clips.



Introducing Lotus Components. Now you can develop customized Notes applications faster than ever before.

Lotus Components are going to revolutionize the way you build your Notes applications. Using pre-built, customizable "applets" you can now burn through your development schedule.

These task-focused, ActiveX controls include a spreadsheet, chart, comment, file viewer, draw/diagram and project scheduler. And each can be reused to build hundreds of customizable business objects for Notes applications never before possible.

For a free copy of The Lotus Components Discovery CD, including a trial of Lotus Components, sample applications, LotusScript Code examples, and more... visit our Lotus Components Website at http://components.lotus.com.

Or for more information call 1-800-TRADE-UP, ext. C199.

Circle 602 on Inquiry Card (RESELLERS: 603).

The three leading API contenders for mainstream 3-D are OpenGL, QuickDraw 3D (QD3D), and Direct3D. The latter has the advantage of Microsoft's marketing might, while the cross-platform capabilities of the other two make them important for developers not tied to Windows.

OpenGL originated as the Graphics Library for the Silicon Graphics, Inc. (SGI), Iris graphics systems. It's the oldest of the three APIs and now has the broadest base among Mac, PC, and Unix developers. It focuses on drawing 2-D and 3-D objects quickly and is generally more low-level than the other two APIs.

For instance, it does not include complex predefined objects, automatic shadows, ray-tracing, or radiosity functions. It's currently the undisputed standard for scientific and engineering applications, and it is associated more with high-end CAD, simulation, and visualization than with photo-realistic games. In a move to broaden the API's appeal from the professional market to general-purpose desktops, SGI recently teamed up with Sun Microsystems to develop CosmoGL, which is a variant of OpenGL that speeds texture mapping for 3-D Web applications and games in Windows 95 and NT.

OpenGL offers an impressive, if basic, array of approximately 120 functions for polygon shading, rotation, scaling, atmospheric effects, depth cueing, and other functions. But OpenGL lacks the object-oriented design of QD3D and Direct3D. You use the API as a *state machine*, which means that parameters "stick" until you change them. This saves work for developers, but nasty bugs can arise if the programmer forgets to save states and restore them when exiting from a routine.

OpenGL uses a client/server model, so it enables you to process compute-intensive tasks in a distributed environment. Because it does not include windowing functions, it works independently of the UI. It attaches to OSes and GUIs through extension libraries.

OpenGL is complemented by Open Inventor, a higher-level, object-oriented library. You can use Open Inventor as a layer above OpenGL to add features such as geometry, motion and lighting, and material editors. Like OpenGL, Open Inventor has been licensed to other companies. For instance, the Virtual Reality Modeling Language (VRML) format for virtual worlds on the Internet is based on Open Inventor.

Why Memory Matters

Memory and memory speed play pivotal roles in how realistic 3-D looks on our screens. It's important for the CPU to write pixel data to the image buffer quickly, but it's much more critical for the graphics-board circuitry to get data out to the screen.

The old VGA standard of 640- by 480-pixel resolution required a total of 307,200 pixels; at 16 colors, these pixels fit into 153,600 bytes of memory. A reasonably fast graphics driver would fill that memory in about a tenth of a second using a memory bandwidth of 1.5 MBps. Because VGA uses a vertical-refresh rate of 60 Hz, 150 KB of image memory had to be output to the screen 60 times per second, resulting in a memory bandwidth of just of over 9 MBps on the video side.

The situation heats up considerably for the modern resolutions of SVGA and better. To accommodate a moderate 1024 by 768 pixels at 65,536 colors (16 bits per pixel), the image buffer has to hold about 1.6 MB of data. Thus, the CPU needs a bandwidth of 16 MBps to write data to the graphics board. This is no big deal on the PCI bus, which can handle up to 60 MBps. But to get the image out to the screen at an ergonomically correct 75 times per second, the board must read from its image memory at 120 MBps. For 1280 by 1024 resolution, you need a sustained throughput rate of 196 MBps.

How memory delivers this performance depends on the bus width used in the graphics card's design. Basically, more memory bandwidth can be achieved either with faster memory chips or by using several chips in parallel. ISA-bus graphics boards and their chips were generally designed for a data-bus width of 16 bits; to support high screen resolutions, you need fast video RAM (VRAM).

VRAM chips are dual-ported: To the graphics chip, they look like standard DRAMs, but a second port is used for output. Thus, data can be read and written simultaneously; screen updates do not result in lost cycles. A recent development, Window RAM (WRAM), is basically faster VRAM enhanced with special graphics features, such as accelerated, aligned fills and moves.

Given that memory comes in a fixed bus width, watch out for boards that support a bus width of 64 or 128 bits but are sold in economy versions where only half the memory is fitted. For example, a 128-bit board might be designed for 4 MB of RAM, needing eight memory chips, each with a bus width of 16 bits. If only 2 MB is installed, which degrades the bus width to 64 bits, you effectively end up with a lower-performance, 64-bit board. Of course, you can install the missing memory later.

Modern boards, which transfer data at 64 or even 128 bits in parallel, can actually use slower, less expensive memory. For example, board designers can combine standard extended data out (EDO) RAM with a 64-bit bus to achieve a throughput of 240 MBps. Burst EDO RAM delivers about 400 MBps.

Memory manufacturers have come up with a variety of special designs for even-faster throughput, needed for larger color palettes. Some designers put several chips in a single housing and combine them with logic circuitry that allows overlapping access. Each unit works at the speed of standard DRAM, but parallelism increases throughput. All the variations of DRAM described below are single-ported.

Synchronous DRAM (SDRAM) and synchronous graphics RAM (SGRAM) are available from several sources and have already found a flock of followers in the graphics-controller industry. While DRAM needs several special strobe signals, synchronous RAM can handle the memory clock directly. At a bus width of 64 bits, SDRAM can support bandwidths up to 640 MBps. SGRAM adds features that accelerate graphics performance, such as block write (which is useful for video).

Multibank DRAM (MDRAM) combines eight 32-KB banks into blocks of 256 KB. It supports 500-MBps throughput. Tseng Labs' ET6000 graphics chip sports a special 128-bit MDRAM interface, yielding up to 1000 MBps.

Rambus DRAM (RDRAM), a general-purpose memory design, has a bus width of only 8 bits and therefore needs a very high memory clock of 250 MHz. Transfers reach 500 MBps.

QD3D, which premiered in early 1995 as a graphics extension to the Mac OS, now includes Windows support. Because QD3D is fully object-oriented, new object instances can inherent complex features (including lighting, geometry, and textures) to simplify the construction of 3-D images.

QD3D stores scene and object information with its own portable data format, which is called 3D Metafile (3DMF); it offers a choice between a compact binary and a human-readable version and supports the cutting and pasting of 3-D objects via the Clipboard. You can store QD3D objects in image databases and use simple drag-and-drop techniques to move objects from the database into a 3-D scene.

QD3D includes standard 3-D primitives, but, unlike OpenGL, it knows about complex geometry, such as nonuniform rational B-splines (NURBS). Its extensible architecture enables you to add new software-rendering engines and access hardware accelerators. Another nice detail is the interactive renderer, which lets you see and manipulate objects directly during design. Many applications let you work with the interactive renderer directly.

For developers who'd rather work with a low-level, but still hardware-independent, 3-D API, Apple offers the Rendering Acceleration Virtual Engine. RAVE can act as a plug-in module within QD3D to provide a hardware abstraction layer (HAL). RAVE includes basic graphics primitives; however, it doesn't offer high-level functions, such as the importing of objects. Like QD3D, RAVE supports Macs and Windows-based machines.

Microsoft's Direct3D, the latest member of the DirectX family of interfaces, is part of a three-layered structure (Direct3D itself is actually the middle layer). The lowest layer is the HAL, which contains the hardware-specific device drivers. Above that is the low-level API layer, which grants access to hardware features while maintaining hardware independence. The layer above it contains Microsoft's own high-level API, previously known as RealityLab (which was snagged in Microsoft's acquisition of RenderMorphics). This highest layer can also accept other APIs as plug-ins, including OpenGL. Above these three layers is the applications layer; below them lies the hardware.

Applications built on the DirectX family can query the system to determine what functions are implemented in hardware. For functions that are not supported, the application might substitute a simpler algorithm. However, Direct3D can also emulate any function in software, thanks to the Hardware Emulation Layer (HEL).

Like QD3D, Direct3D offers a clean, object-oriented, extensible architecture. What functions are actually available depends to some extent on the high-level layer. With the default RealityLabs API on top, Direct3D is not as versatile as QD3D because it lacks basic 3-D objects, such as cylinders, spheres, and cones. Still, it offers functions that go beyond OpenGL's, including animation features, which are particularly useful for games developers. Direct3D's main drawback it that it's limited to Win 95.

The 3-D Future

Eventually we may take 3-D for granted, much like gigabyte-capacity hard drives and 16 MB of memory. However, because 3-D adds complexity to applications, it will take a fair amount of time for software developers to master the technology. Therefore, we probably won't see 3-D hit critical mass until 1997 or later. Until then, only games publishers, who stand to profit first and most by 3-D, will be willing to devote significant resources to the development of 3-D.

Just like the GUI-enhanced software that seemed so cumbersome to users for many years, 3-D will suffer many development blunders along the way before killer 3-D apps emerge and 3-D UI elements become as natural and efficient to use as today's dialog boxes and scroll bars. And as 3-D becomes pervasive, business users will need, rather than just want, 3-D enhancements. B

API
Strengths and Weaknesses

OpenGL

+ Supports Mac, PC, and Unix developers.
+ Quickly draws 2-D and 3-D objects.
+ Offers an impressive array of rendering functions.
- Not object-oriented.

QuickDraw 3D

+ Supports the Mac OS and Windows.
+ Fully object-oriented.
+ Lets you drag and drop objects into a 3-D scene.
+ An interactive renderer manipulates objects during design.

Direct3D

+ A member of the DirectX family of interfaces.
+ Offers a clean, object-oriented, extensible architecture.
- Not as versatile as QuickDraw 3D, because it lacks some basic 3-D objects.
- For Windows only.

NT in Real Time

Clever modifications of Windows NT make it a compelling OS choice for some embedded applications.

By Rick Grehan

Pity the embedded-systems developer when it comes time to choose a real-time OS (RTOS). The approximately 40 RTOSes now on the market present an embarrassment of riches; each one offers slightly different capabilities and development tools. So, for a developer on a deadline, he or she may spend a lot of valuable time searching for the right tools—time that would be better spent developing the actual program.

Life would be easier if embedded-systems developers needed only to choose among a handful of general-purpose OSes, such as Windows NT, that have been customized into embedded, real-time versions. Phar Lap Software and Venturcom are doing just this kind of customization: Both are offering real-time variations of NT. The approaches these two organizations take with their products are quite different, but both of them count on catching some of NT's wake.

NT's Coattails

The potential rewards of using Phar Lap's TNT Embedded ToolSuite, Realtime Edition, version 8.0 (ETS), and Venturcom's Real-Time Extension (RTX) are manifold. First, if you're already familiar with programming to NT's API, you don't have to go to the trouble of learning a new API to use them. All the programming knowledge that you've gained while working with NT in the desktop realm becomes applicable for real-time applications.

Second, programmers can choose from a wide range of development systems. Custom real-time OSes often require the purchase of equally custom and expensive development tools. By contrast, developers using ETS or RTX have the option of using standbys, such as Microsoft's Visual C++ and Borland C++. Along with these tried-and-true development tools come some substantial piles of documentation and various other educational materials that are often missing in some custom OSes.

Third—and most important—both the host-development and target systems can run the same OS. This means that a great deal of the software development work can be completed before the target hardware is even available to the software engineers. (Venturcom's RTX runs on any Intel hardware that supports NT. Phar Lap's ETS supports standard AT architectures, starting with the 386SX.)

The Challenge

Embedded-systems developers have a short list of "must have" features for any RTOS, whether it's a custom design or one built from a general-purpose OS. For example, a multithreaded RTOS with a moderately sophisticated memory management system must be able to safeguard against the memory-manager thread's waking up and preempting a time-critical interrupt service routine. (The memory-manager thread operates at a high priority to maintain system consistency.)

Such safeguards are critical to providing *determinism*. An RTOS is said to be deterministic if a designer is able to figure out precisely how the system will behave given any set of inputs and the current state of the system at the time the inputs arrive. Most of the time, this boils down to a known and guaranteed task-scheduling protocol.

Because embedded applications usually offer limited memory resources, another important characteristic of an RTOS is the ability to tolerate small living quarters. Some embedded systems must endure size and power restrictions; both translate directly to limits on the amount of silicon a developer can throw at the application. If the real-time system won't fit, no amount of shoehorning will fix the problem. Finally, an RTOS must provide adequate development tools.

Both ETS and RTX need to solve these problems *and* work

ILLUSTRATION: DEBBIE SUME © 1996

compatibly with NT, even though NT doesn't natively provide the deterministic task-scheduling necessary for RTOSes. In addition, NT typically runs with applications that offer 32 to 64 MB of memory—which is hardly a small footprint. While development tools for NT are common, developers using the Phar Lap and Venturcom products need to use those tools in a specialized way.

Inside ETS

Phar Lap's ETS owes a great deal of its heritage to the company's venerable TNT DOS Extender. TNT brings a subset of the Win32 API into a DOS extender to provide developers with access to NT-style multithreading and all the NT-synchronization objects (e.g., events, critical sections, mutexes, and semaphores). Most important, however, is the fact that TNT is a 32-bit flat-memory-model environment. It's about as close to NT without the Windows as you can get. To produce ETS, Phar Lap took the basic TNT technology and added a context-switching and memory-managing heart to produce a stand-alone kernel.

Note that ETS is a single-process, multithreaded environment. It's important to remember that ETS is not *true* NT; it's based on a subset of the Win32 API. The context-switching component provides determinism via the following easy-to-remember principle: The highest-priority runnable thread will run. This means that a thread will run until it becomes blocked (e.g., while waiting for completion of an I/O operation) or its time slice expires and a thread of equal or higher priority is ready to run.

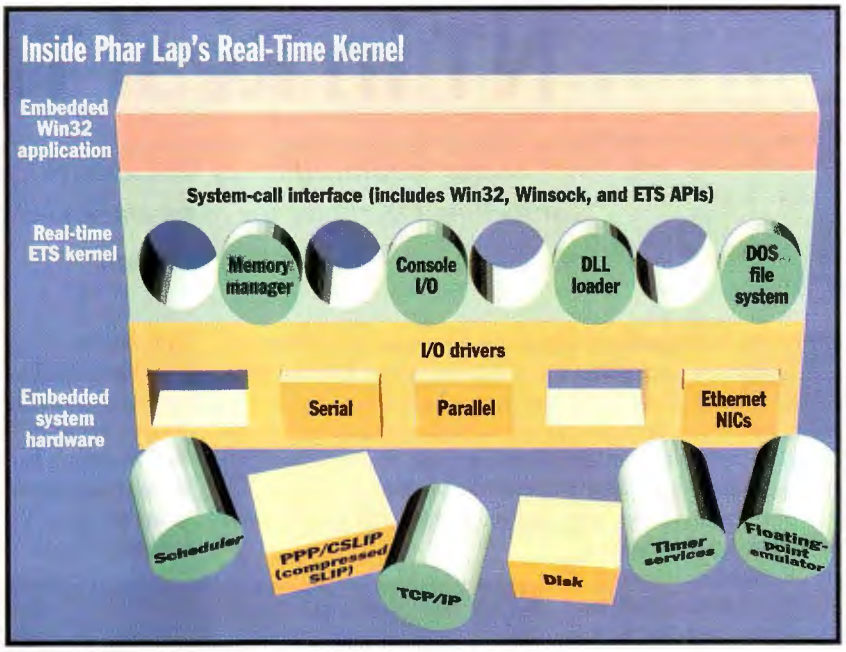
By contrast, task scheduling in Windows NT is not deterministic. Because ETS is basically a real-time kernel rather than a full-blown OS with its own development tools and supporting applications, it's aimed primarily at the embedded developer working in C and C++. Fortunately, ETS allows a development tool to be selected from among several of the standard NT C/C++ compilers. ETS applications can be constructed using Microsoft's Visual C++, Borland C++, or MetaWare High C/C++.

Well-Timed Interrupts

To understand Venturcom's RTX, you must first understand how NT's hardware abstraction layer (HAL) handles system timing. The HAL intercepts timer interrupts produced by a system's hardware clock. NT's designers programmed these interrupts to occur once per millisecond; the HAL essentially passes the interrupts "up" to the NT kernel. This once-per-millisecond interrupt, which forms the smallest resolution of the NT system, is used to manage device drivers that request timer services.

Every 10 ms, the NT kernel nudges the NT scheduler, which performs whatever process and thread scheduling needs to be done. Hence, 10 ms represents NT's fundamental process/thread time slice. RTX's real-time extensions depend on a cleverly modified HAL that programs the hardware so that interrupts occur once every 100 *microseconds*.

This modified HAL delivers interrupt notification in two directions. First, the new HAL continues to inform the NT kernel of interrupts once every 10 ms. In this respect, the NT kernel is unaware that the HAL is acting in a different manner. The second notification sequence, however, sends an interrupt every 100 µs to Venturcom's RTX. RTX is a sort of real-time kernel that appears to the remainder of NT as a device driver, so it's simultaneously a part of and separate from NT. Tasks running in RTX run at priorities higher than those of NT interrupt handlers. Consequently, RTX tasks cannot be preempted by NT tasks.



The ETS kernel lets you add or delete services and hardware device drivers to match the needs of each application.

Thus, NT's normal functions run unimpaired so that real-time software can execute on an NT system side-by-side with standard, off-the-shelf software. Also, because tasks in the real-time extension execute at a higher priority than NT processes and threads, NT tasks won't destroy the determinism of the real-time extension. Finally, developers can use RTX for SMP (symmetric multiprocessing). On a dual-processor system, one processor can run the real-time extension, and the other one can run NT with no degradation in performance.

Build Your Own Kernel

Both ETS and RTX address the resource limitations of embedded systems via associated products that let you custom-construct a kernel. Phar Lap's Visual System Builder, which comes bundled with ETS, lets you identify what pieces you want in your kernel (e.g., keyboard driver or timer driver). Operating Visual System Builder is straightforward: You simply click on check boxes that correspond to the desired components, and the Builder automatically assembles the proper modules. When you compile and link your application's executable image, ETS pulls in the selected modules.

RTX's optional Component Integrator is more elaborate because it helps you assemble a customized version of a full-

WHEN CONSIDERING A SERVICE BE SURE TO READ THE GIGANTIC

NEXT-BUSINESS-DAY AT-YOUR-DESK SERVICE GUARANTEE*

If your Dell system experiences a covered hardware failure while it is under a next-business-day, on-site service contract purchased from Dell, and if Dell has dispatched a service call before 5:00 PM local customer time, Monday through Friday, a technician, if needed, will arrive at your location to address your problem by the end of the next business day. In the rare event that the technician does not arrive as promised, let Dell know. Your situation will receive top priority for resolution, plus you will receive an additional month of service for free.

GUARANTEED.

blown NT system. The modules that the Component Integrator must cope with are more complex than keyboard drivers and serial drivers, and these modules are also interdependent. The ultimate goal, however, is the same for both ETS and RTX. Each one allows you to construct a tuned OS core that has only the pieces your application needs.

How do the two products compare in scalability? That depends on your perspective. Developers who measure ETS by its ability to bear the burden of increasing numbers of tasks find that the product fares well. For example, Ark Degtiarov, principal software engineer for Nova Biomedical, a Boston-based biomedical instrumentation manufacturer, says that his company's blood-analyzing system runs about 40 simultaneous tasks using ETS. He adds that he has never seen a problem with system stability.

Developers might measure scalability with Venturcom's RTX by the number of NT services that are available in conjunction with RTX. Given that, the Component Integrator provides all the scalability necessary at the upper end of the spectrum; there's no reason why a full-blown NT kernel can't be run in conjunction with RTX.

For a deeply embedded application, however, there's a lower end to the spectrum. A minimum embedded NT system with RTX requires about 8 MB of memory (5 to 6 MB for NT, and the rest for the embedded application). ETS fares much better in tight spaces; depending on how the kernel is carved up, it can take as little as 27 KB of memory.

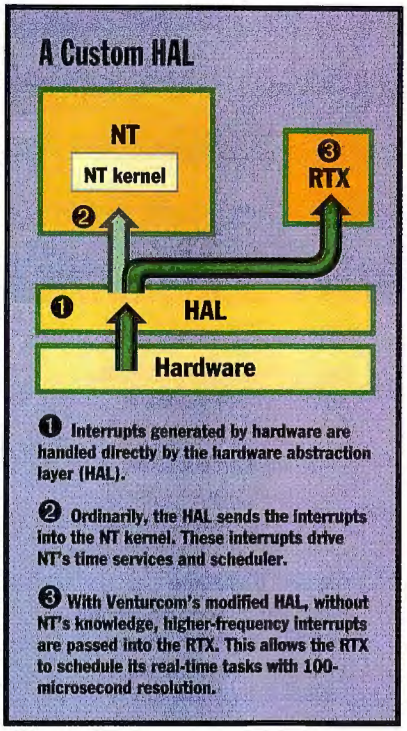
The Dark Side

Before you think that these products offer perfect solutions, consider some of their drawbacks. For starters, Venturcom's RTX is in an early incarnation and currently supports only soft real-time. In other words, RTX's high-performance, deterministic characteristics have not yet been implemented—and this is not expected until later this year or early 1997. (A "hard" real-time system guarantees an immediate response to a given stimulus regardless of the system state. In contrast, a "soft" real-time system can tolerate an occasional fraction-of-a-second delay. For example, microwave ovens are soft real-time systems; you wouldn't notice if the oven responded in 3/10 second, rather than 1/10 second, after you pressed the Start button.) In defense of the product, the company claims soft real-time satisfies 95 percent of the real-time marketplace.

Then there's the aforementioned RTX footprint of about 8 MB. On one hand, this excessive memory requirement exists because RTX runs full-blown NT, not some subset of the Win32 API. On the other hand, this is likely to eliminate RTX from consideration for many deeply embedded applications.

Phar Lap's ETS tackles the real-time embedded market at a lower level than RTS does. This means you'll need to program in C or C++ if you choose to work with it. This isn't completely a fault of ETS; it's intrinsic to hard real-time development. However, this means that the ETS environment is more primitive than what RTX offers. With ETS, you can't currently run an off-the-shelf database package alongside your real-time data-acquisition system.

Note that this primitiveness does not imply higher performance on the part of ETS. (It's often the case that the lower an application's level, the higher its raw performance.) On the contrary, one complaint about ETS is its poor latency (i.e., the time it takes the system to respond to an interrupt). Additionally, the minimum time slice for threads running under ETS is 10 ms (the same as for a "regular" NT thread). Compare that to RTX, which can schedule real-time threads in 100-µs time slices.



RTX relies on a customized HAL that lets NT operate in real-time applications.

The Choices

These two products take fundamentally different approaches to handling NT. Therefore, you shouldn't have much trouble distinguishing when it's best to use one rather than the other.

Venturcom's RTX and Component Integrator target the high end of the embedded marketplace. These tools benefit applications that incorporate a mixture of real-time and desktop software.

Imagine, for example, a system that controls a complex manufacturing process and perhaps runs a factory's automated assembly line. The shop-floor manager—who's already familiar with the NT interface on the desktop in the office—can go to the shop floor and use the same graphical interface to reprogram the assembly line. If this reprogramming task requires that a set of device-control parameters be called up from a database, this could be done with an Access database that communicates directly with the real-time extension tasks that control the devices on the assembly line.

Meanwhile, Phar Lap's ETS works efficiently with deeply embedded applications where resources (available memory, for example) are scarce. Small, application-specific devices that don't require graphical interfaces or a great deal of mass storage are perfect candidates for ETS applications.

In addition, both of these products face some stiff competition from Unix-based RTOSes, such as QNX and Lynx. Still, NT is one big rolling snowball. And although NT is just now entering the embedded world, developers may feel safer working behind the snowball rather than in front of it. B

Does Digital Video Get Any Better?

Yes, it does:

miroVIDEO DC30.

Professional studio quality video for your PC,

because

miroVIDEO DC30 PCI bus mastering provides the fastest data rates (up to 6 MB/sec), the highest resolution (4:2:2 YUV TrueColor) with the best image quality (3.5:1 compression).

CD quality audio with perfect lip synchronization,

because

miroVIDEO DC30 integrates audio with video on a single board so you don't miss a beat.

Real-time video-overlay,

because

miroVIDEO DC30 displays full-motion video directly on the PC monitor at all times. True WYSIWYG video during capture, edit and print-to-tape.

Optimal hard disk usage,

because

miroVIDEO DC30 has fully adjustable video resolution and compression settings to provide the best video quality in the space available.

High-speed video editing,

because

miroVIDEO DC30 has specialized hardware and world-class drivers to accelerate video editing software – up to 10 times faster with Adobe Premiere software during "make movie" and "preview edit" mode.

Professional digital video and audio editing system

- PCI bus mastering technology, for the fastest data rates up to 6 MByte/sec.
- On-board CD audio
- Ready for Windows 95
- Input and output for S-VHS, Hi8, VHS, Video8
- All standards: NTSC, PAL, Secam at CCIR 601 pixel format and square pixels

How to Tame Big Networks

Whether you're designing, simulating, or maintaining extra-large networks, smart software tools can help.

Quantity has a quality all its own. While running a 10-node network might be challenging, and handling a 100-node network might be absorbing, designing and maintaining a 1000-plus-node network are harrowing tasks. The larger the network, the more likely it is to contain a variety of hardware platforms, OSes, connection schemes, and protocols that span countries and continents. In short, bringing order to this potential chaos is more than a single, mortal administrator can handle.

The mega-network administrator's primary concern, of course, is how to foist off this crushing burden. The good news here is that tools exist just for this purpose.

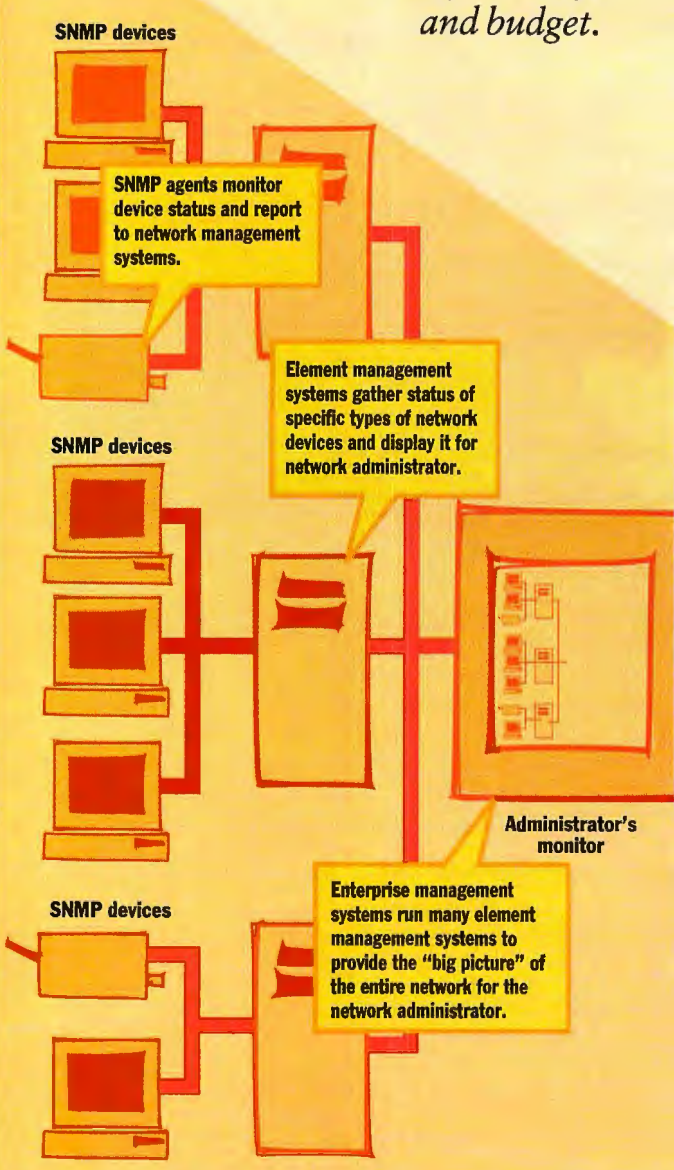
For example, designing a large network or adding onto your existing behemoth can be taxing, since you have to consider so many parameters, including throughput, location, compatibility, size, and budget. New graphical tools let you assemble big networks from databases of components as if you're piecing together Tinkertoys—and smart Tinkertoys at that, since some of these tools can tell you if you're making blunders such as using an underpowered server for an engineering workgroup.

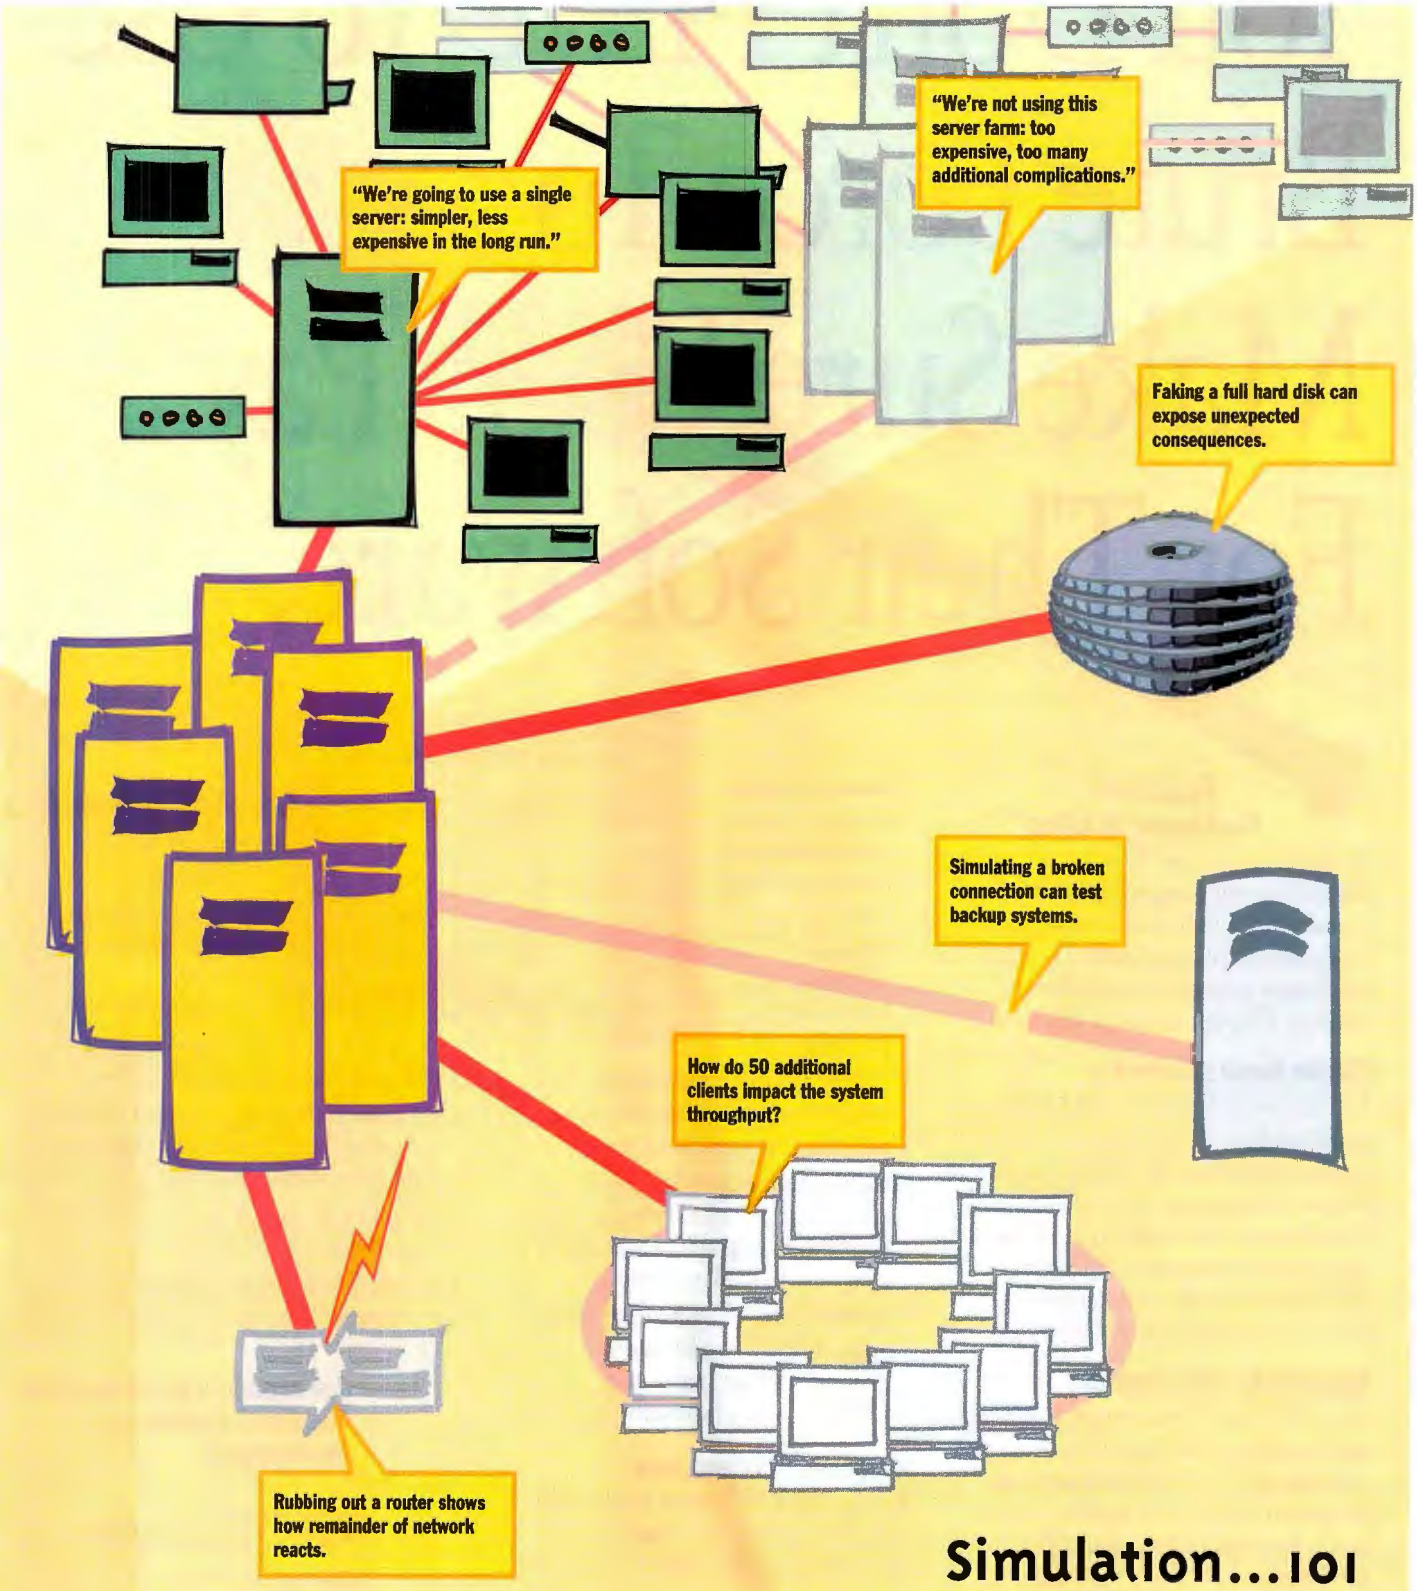
If instead of designing a network from scratch you must integrate two existing networks, modeling tools can give you the big communications picture. Some products make you get your hands dirty and fill in all the details about the components yourself, while others, using "automatic discovery," quiz the myriad components and construct a model for you.

With so many interconnected components to watch over, maintenance might be your biggest headache. Most network-administration centers look like NASA Mission Control, with all their flickering monitors, each tuned to specific hardware components. Enterprise management systems can reduce the number of monitors you have to stare at each day, and they also consolidate information that logically belongs together. Event-correlation capabilities can even figure out automatically that, yes, it *was* that iffy router on the thirteenth floor that just triggered the 42 irate calls the help desk just fielded.

The harried system administrator is no longer alone in the battle to keep a company's information electrons flowing efficiently. And that can bring some quality to the business of handling all that quantity.

–Edmund X. DeJesus

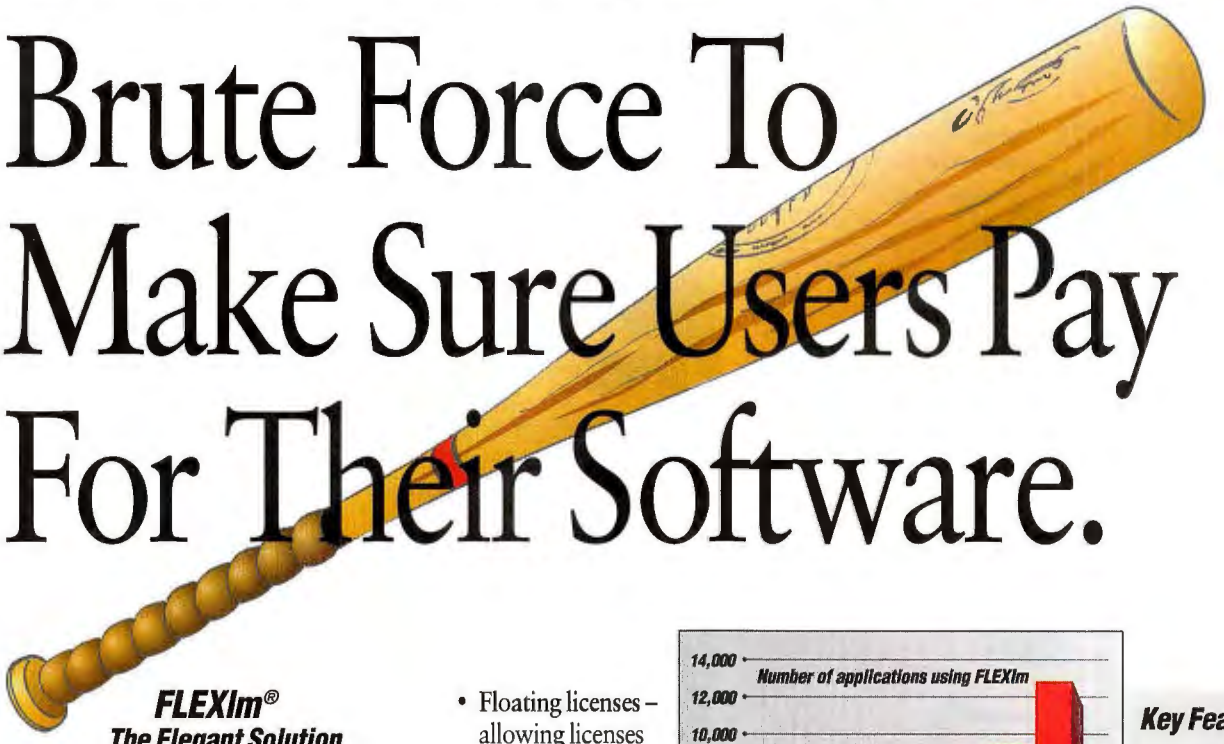




Simulation...101

Simulation brings your big picture to life, allowing what-if scenarios that you pray will never happen.

You Don't Have To Use Brute Force To Make Sure Users Pay For Their Software.



FLEXlm®
The Elegant Solution

You don't have to use the brute force of a baseball bat – or dongles for that matter – to make sure only licensed, paying users have access to your software. There's a much more elegant and cost-effective solution: FLEX*lm* from GLOBE*trotter*.

The De Facto Standard

FLEX*lm* is bundled in over $15 billion of installed UNIX™ and Windows™ software products, making it the *de facto* standard in license management. And in 1995 alone, FLEX*lm* was used to ship over $3 billion in software licenses over the Internet. That makes it the *de facto* standard in electronic commerce for software, too.

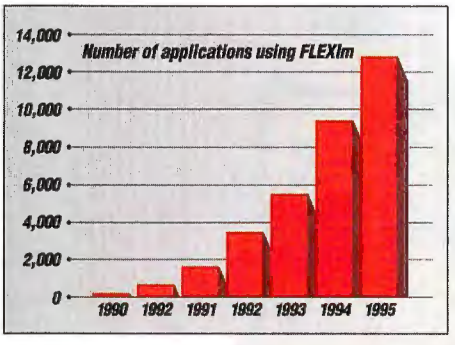
Even Works With Dongles

If you still want to use dongles, FLEX*lm* significantly reduces the number you need at a customer site by allowing low-cost dongles to be used as "network dongles," and by sharing dongles across different products.

Your Customers Will Like It

In an independent survey, users preferred FLEX*lm* eighteen-to-one over other license managers. And all of us know customers really don't care for dongles. With FLEX*lm*, your customers benefit from:

- Floating licenses – allowing licenses to be shared over a network, while fairly compensating the vendor with a higher price per license.
- Fully functional evaluation software while the vendor knows the software will stop after a specific date.
- Built-in license compliance – customers don't need to buy expensive license metering utilities to verify they comply with vendor license terms.
- Installing software where it is most appropriate from a hardware or administration perspective, while protecting your software.



Windows, UNIX and Java

If your company develops products on multiple platforms, you should know FLEX*lm* runs on Windows, UNIX and Java.

For More Information

Call us at 408-370-2800, email us at info@globetrotter.com or visit our website at http://www.globetrotter.com. We'll be happy to arrange a demo and show you how to make sure all your users are licensed.

Key Features:

With FLEXlm you can:

- *Limit software use to licensed users*
- *License software in new ways to gain new markets and customers*
- *Leverage the Internet and CD-ROMs to increase sales while reducing selling and manufacturing expenses*
- *Reduce the cost of product evaluation programs*
- *Significantly reduce the use of expensive dongles*

Forget pencil and paper: Today's intelligent tools do the design work for you. By Nathan J. Muller

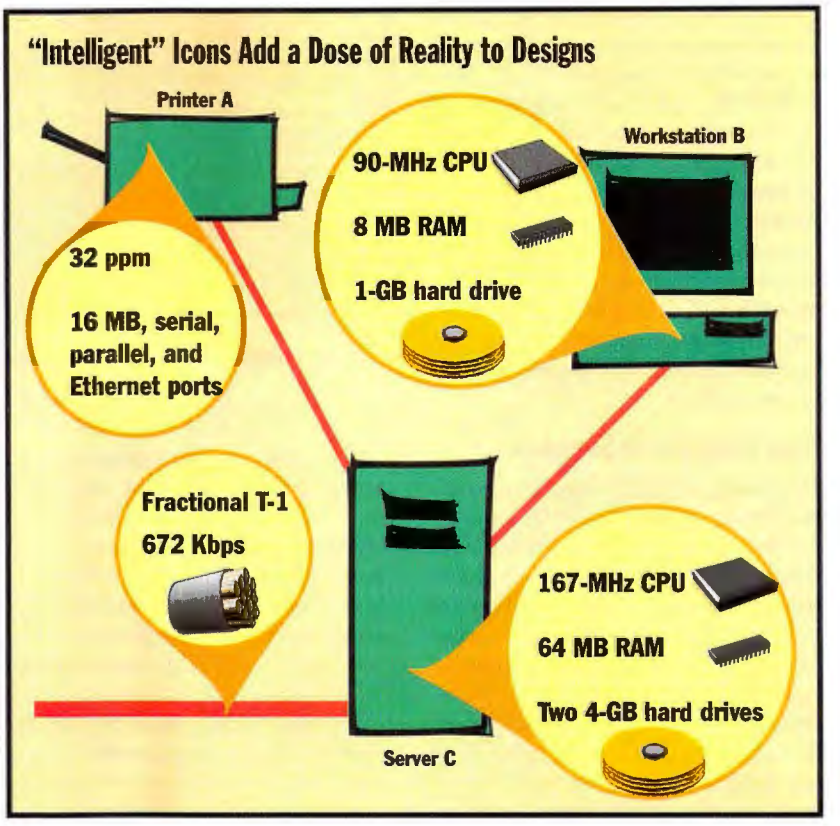
Design and Conquer

Experience tells us that a properly designed network can help an organization improve customer service, pursue new business opportunities, and respond faster to market forces. But large networks, often supporting tens of thousands of users worldwide, present special design challenges. Typically, such behemoths consist of a dizzying array of transmission facilities, LAN technologies, protocols, and standards—all cobbled together to meet the differing needs of workgroups, departments, branch offices, divisions, subsidiaries, and, increasingly, strategic partners, suppliers, and customers.

As if this complexity were not enough, big networks are usually in a state of flux. Corporate requirements, technologies, and standards change over time. Carriers introduce new services. Vendors offer new and better products. With continual moves, adds, and changes, a company's traffic patterns begin to shift. Before you know it, applications are gasping for bandwidth, response time slows to a crawl, and frustrated users start looking steely-eyed at the network administrator.

Hidden costs associated with poor network designs include overspending on equipment and WAN links to ensure sufficient capacity, trouble reports, poor response to network problems, unpredictable delays in meeting work schedules, and high labor costs for frequent rush jobs.

Fortunately, automated tools are available to help you head off these sorts of problems at the pass. With built-in intelligence, these tools take an active part in the design process (see "Design's Four Stages" on page 94). With the type of software we'll discuss in this article, you can build a computerized model of a network; validate its design and gauge its performance; quantify equipment requirements; and explore reliability and security issues before you purchase a single network component. Some of these tools may even identify faulty equipment configurations, design flaws, and standards violations.



With some network design tools, hardware icons contain configuration information about the components they represent.

Network Designer Tools

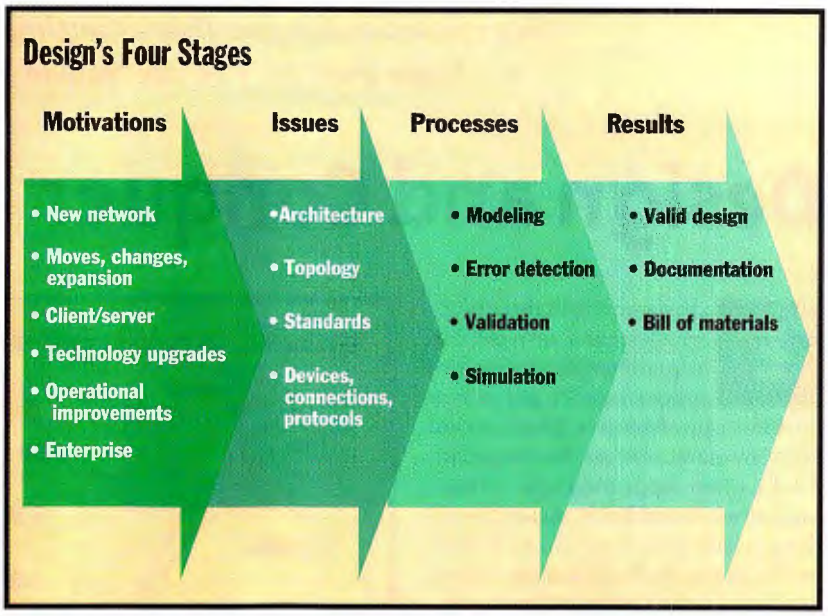
Because of the size of the network designs they handle, these tools typically run on Windows NT, Unix, and SunOS. There are two notable exceptions: Supporting Windows 95 (as well as Windows 3.1) are Network Design and Analysis's AutoNet, a program for designing T-carrier networks, and American Hytech's NetGuru, for designing LANs and networks of unlimited size.

At the low end, prices for design tools begin at $495 (for NetGuru). At the high end, prices range from $5000 for ImageNet's CANE (Computer Aided Network Engineering) to $15,000 or more for MIL 3's OpNet and Make Systems' NetMaker XA, depending on the type and number of optional plug-in modules. For companies that do not have the time or expertise to learn and use these tools themselves, some vendors, such as Make Systems, offer outsourcing services based on their software; cost of such services starts at $1750 a day.

When working with these tools, you begin the build-a-network process by opening a blank drawing window, into which you can drag various vendor-specific devices—workstations, servers, hubs, routers—from a product library and drop them into place (see the screen

on page 96). You can further define the devices by component type, software, and protocols, as appropriate. Lines link the devices to form a network, and each link gets assigned physical and logical attributes. Rapid prototyping provides the ability to copy objects—devices, LAN segments, network nodes, and subnets—from one drawing to the next, editing as necessary, until you have built the entire network. Along the way, you can run various simulations to test virtually any aspect of the design.

With the right tools, modules, and device libraries, you can design every conceivable type of network, including legacy networks such as Systems Network Architecture (SNA) and DECnet; voice networks including ISDN; and T1, X.25, asynchronous transfer mode (ATM), and TCP/IP nets. Some tools, such as MIL 3's OpNet, let you incorporate satellite, microwave, and other kinds of wireless technologies.



Large-network design tools can improve and simplify every stage of the design process.

Starting from Scratch

Designing a large, complex network requires a multifaceted tool, preferably one that is graphical, object-oriented, and interactive. It should support the entire network life cycle, from the definition of user requirements and conceptual design to the detailed vendor-specific configuration of network devices, their protocols, and the various links between them. At each phase, the tool should be able to test design alternatives for cost, performance, and validity. When the design checks out, the tool should spew out network diagrams and a bill of materials. All this happens before you contact a single equipment vendor or carrier sales rep or write an RFP.

For administrators embroiled in the complexities of network design, this kind of tool represents a dream come true. ImageNet's prerelease version of CANE, an integrated set of Windows NT applications, comes close to meeting this ideal. Designers can take a top-down or a bottom-up approach to network construction. In the top-down approach, the designer starts by sketching out the overall network, then adds increasing levels of detail until every aspect of the network is eventually fleshed out. The bottom-up approach might start with a LAN in a specific department to which you link subsequent drawings to create the overall network structure.

As the drawing window populates, you can further define devices by component type—such as chassis, interface cards, and daughterboards. You can even specify the operating system, such as "NetWare 3.12 client for a Compaq Presario 660 PC." You can add attributes (like protocol functionality) to each device taken from a library. Once you've configured the devices, each device gets a profile that specifies its traffic characteristics for simulating the network's load and capacity.

Having defined each device's configuration, lines between them form the network. CANE then validates the links, testing for common protocols and network functions. This prevents obvious mistakes, such as NetWare clients connecting to other clients instead of servers, for example. This on-line analysis feature also alerts the designer to undefined links, unconnected devices, insufficient available ports in a device, and incorrect addresses in IP networks. An off-line analysis tool reports violations of network integrity and proper network design practices. The designer can analyze the network's structure, its IP completeness, or both at once.

CANE simulates the completed network, using a database that describes how actual network devices behave under various real-world conditions. The simulator generates network events over time, based on the device and traffic pattern recorded in the simulation profile. The designer can test the network's capacity under various "what if" scenarios and fine-tune the network for optimal cost and performance. Simulation in the prerelease version of CANE operates on one LAN segment at a time. By the time you read this, the commercial version of CANE will support fully integrated enterprisewide LAN and WAN simulation.

Better Designs, the "Primitive" Way

The Make Systems design package focuses on building WANs. Among the company's set of six core tools in NetMaker XA is the Designer module. Designer allows you to build cost-effective topology and clocking designs—from the ground up or incrementally—using a library of building-block "primitives."

With the time-division multiplexing (TDM) primitives library, for example, you can build an entire T1 network within your specified parameters and constraints. You can strive for the lowest transmission cost that supports all traffic, for instance, or for line redundancy between all the TDM nodes. Each primitive addresses a different aspect of the design. You can run tail circuit design, hub selection, or redundancy primitives as needed. You can combine them to address the overall design objectives. You can pause the design process after each design

STATISTICA

Windows 3.1 and WINDOWS 95

STATISTICA (automatically configures itself for *Windows* 95 [long file names, etc.] or 3.1) ■ A complete data analysis system with thousands of on-screen customizable, presentation-quality graphs fully integrated with all procedures ■ Comprehensive *Windows* support, OLE (client and server), DDE, customizable *AutoTask* toolbars, pop-up menus ■ Multiple data-, results-, and graph-windows with *data-graph* links ■ The largest selection of statistics and graphs in a single system; comprehensive implementations of: Exploratory techniques with advanced brushing; multi-way tables with banners (presentation-quality reports); nonparametrics; distribution fitting; multiple regression; general nonlinear estimation; stepwise logit/probit; general ANCOVA/MANCOVA; stepwise discriminant analysis; log-linear analysis; confirmatory/exploratory factor analysis; cluster analysis; multidimensional scaling; canonical correlation; item analysis/reliability; correspondence analysis; survival analysis; a large selection of time series modeling/forecasting techniques; structural equation modeling with *Monte Carlo* simulations; and much more ■ On-line *Electronic Manual* with comprehensive introductions to each procedure and examples ■ Hypertext-based *Stats Advisor* expert system ■ Workbooks with multiple *AutoOpen* documents (e.g., graphs, reports) ■ Extensive data management facilities (fast spreadsheet of unlimited capacity with long formulas, *Drag-and-Drop*, *AutoFill*, *Auto-Recalculate*, split-screen/variable-speed scrolling, advanced Clipboard support, DDE links, hot links to graphs, relational merge, data verification/cleaning) ■ Powerful *STATISTICA BASIC* language (professional development environment) with matrix operations, full graphics support, and interface to external programs (*DLLs*) ■ Batch command language and editable macros, flexible "turn-key" and automation options, custom-designed procedures can be added to floating *Auto Task* toolbars ■ All output displayed in Scrollsheets™ (dynamic, customizable, presentation-quality tables with instant 2D, 3D, and multiple graphs) or word processor-style report editor (of unlimited capacity) that combines text and graphs ■ Extremely large analysis designs (e.g., correlation matrices up to 32,000x32,000, unlimited ANOVA designs) ■ Megafile Manager with up to 32,000 variables (8 Mb) per record ■ Unlimited size of files; extended ("quadruple") precision; unmatched speed ■ Exchanges data and graphs with other applications via DDE, OLE, or an extensive selection of file import/export facilities (incl. *ODBC* access to virtually all data bases and mainframe files) ■ Hundreds of types of graphs, incl. categorized multiple 2D and 3D graphs, ternary 2D/3D graphs, matrix plots, icons, and unique multivariate (e.g., 4D) graphs ■ Facilities to custom-design new graph types and add them permanently to menus or toolbars ■ On-screen graph customization with advanced drawing tools (e.g., scrolling and editing of complex objects in 32x real zoom mode), compound (nested) OLE documents, *Multiple-Graph AutoLayout Wizard*, templates, special effects, icons, page layout control for slides and printouts; unmatched speed of graph redraw ■ Interactive rotation, perspective and cross-sections of 3D displays ■ Large selection of tools for graphical exploration of data: extensive brushing tools with animation, fitting, smoothing, overlaying, spectral planes, projections, layered compressions, marked subsets ■ Price **$995**.

Quick STATISTICA (for Windows) ■ A subset of *STATISTICA*; comprehensive selection of basic statistics and the full analytic and presentation-quality graphics capabilities of *STATISTICA* ■ Price **$495**.

STATISTICA/QC - *Industrial statistics add-on package* (requires *STATISTICA* or Quick *STATISTICA* for Windows) ■ The largest selection of industrial statistics in a single package; quality control charts (compatible with real-time data acquisition systems), process capability analysis, R&R, sampling plans, and an extremely comprehensive selection of experimental design (DOE) methods ■ Flexible tools to customize and automate all analyses and reports (incl. "turn-key" system options, and tools to add custom procedures) ■ Price **$495**.

STATISTICA/Mac (for Macintosh) ■ Price **$695** (Quick - **$395**).

Domestic sh/h $12 per product; 30-day money back guarantee.

STATISTICA has received the highest rating in EVERY comparative review of statistics software in which it was featured, since its first release.

primitive executes to study the results and adjust network parameters if necessary.

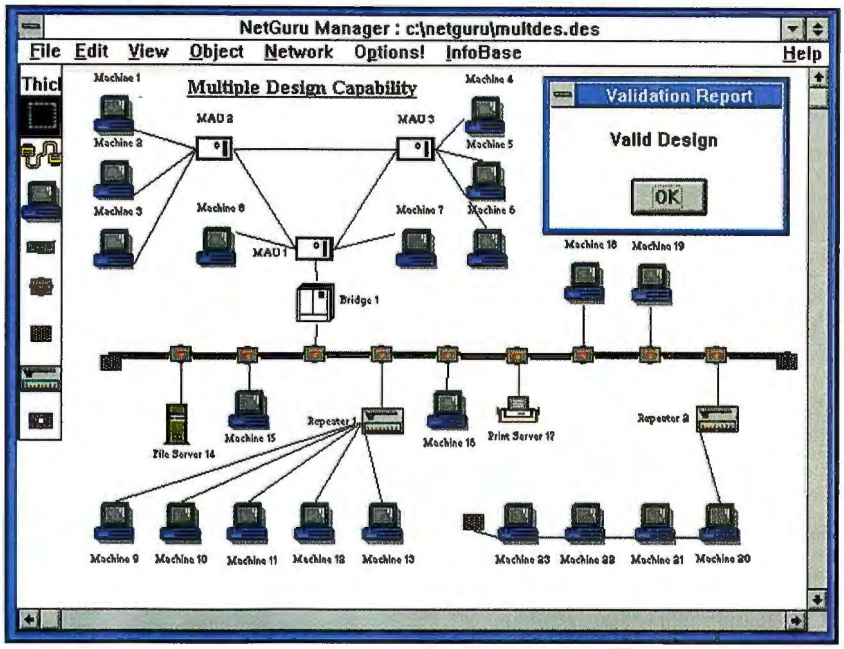
Designer uses Planner (another NetMaker tool) to run device-specific simulations to ensure that the network design is feasible and will route all traffic successfully. Since the simulation is vendor-specific (via plug-ins) there is less chance that the network will be overbuilt just to guarantee the handling of all traffic. A tariff database can price transmission links and determine the most economical network design.

The Modeling Approach

Sometimes it's best to approach unfamiliar territory by scoping out the terrain before committing time and resources to development; this strategy is especially helpful with large networks. Perhaps you want only to assess the feasibility of implementing a certain type of network by playing with a model's various design issues and evaluating the consequences for your organization. MIL 3's OpNet provides standards-based protocol models against which simulations can run within its multilevel development environment. Its model libraries let you do this with a variety of network technologies including frame relay and ATM.

Frame relay, with efficient statistical multiplexing of data and low overhead, has gained broad acceptance in large networks. As frame relay supplements—and replaces—legacy technologies such as X.25 and TDM, important issues arise. These issues include the benefits of frame relay versus the benefits of existing network technology, its use with other emerging technologies such as ATM, and its interoperability with higher-level protocols such as TCP/IP.

OpNet's frame relay models let you build entire networks—complete with configurable objects such as routers, switches, and access devices—so you can study their behavior in great detail. The switch model, for instance, supports the creation of routing tables, switching rate, and buffer capacity for each outgoing link. Among the parameters that can be applied to the permanent virtual circuits (PVCs) are the committed information rate (CIR), committed burst size (Bc), and excess burst size (Be). Incorporating such details into the design allows you to study a variety of network alternatives and assess the impact of new features such as switched virtual circuits (SVCs).



Each item drawn in NetGuru is an intelligent icon that references information for network design, validation, and simulation.

Despite their embedded intelligence, CANE, NetMaker, OpNet, and other stand-alone design products lack the comprehensive automatic discovery capabilities found in heavy-duty management platforms. Hewlett-Packard's OpenView, IBM's NetView/6000, and Sun's Solstice SunNet Manager automatically detect various network elements and represent them with icons on a topology map. Stand-alone products are better suited for creating new large-scale networks than for changing existing ones, at least for now.

Still, the shape of things to come is apparent in Make System's NetMaker XA 2.5, which can automatically discover frame relay PVCs. Expect autodiscovery to be the next development focus of independent tool makers in the coming year. Meanwhile, high-end stand-alone products still offer more advanced design capabilities. They incorporate a broader range of network technologies and equipment makes and models than the design tools that come with network management systems.

Bargain Power Tool

Developing a large-scale network does not always require high-priced design tools. To plan a large network that has thousands of PCs, workstations, and servers attached to hubs—interconnected via bridges or routers over IP networks—you could, for example, use American Hytech's NetGuru, a $495 package that runs under Windows 3.x.

NetGuru allows network professionals to design, validate, and document LANs of any size, including ARCnets (see the screen above). It validates a network design based on standards—or de facto standards—with an internal rule-checking knowledge base that you can invoke at any time. The validation ensures that all network components are accounted for—including network interface cards, converters, terminators, transceivers, multistation access units (MAUs), bridges, repeaters, routers, hubs, and different cable types—before you start building a network or making additions to one. If a device is misconfigured or a 10Base-T wire exceeds the IEEE standard length, for example, NetGuru alerts you. For the truly adventurous, the program has an expert mode that allows experienced designers to override standards and push the envelope.

NetGuru can be used to design only LANs and large-scale IP networks—not WANs that include TDM, frame relay, ATM, or wireless technologies. Nevertheless, the program has many features of higher-priced packages, including object orientation and device libraries, drag-and-drop component assembly,

The Pentium Pro chip-based server you can afford.

DELL® POWEREDGE® 2100 SERVER
180MHz PENTIUM® PRO PROCESSOR

- ★ **32MB Error Correcting Code (ECC) EDO Memory (256MB Max)**
- 256KB Integrated L2 Cache
- Integrated PCI Ultra/Wide SCSI-3 Controller
- ★ **2GB Fast/Wide SCSI-2 Hard Drive [7200RPM, 8ms] (12GB Max)**
- 8X SCSI CD-ROM Drive
- ★ **3Com® 3C595 10/100 PCI Network Adapter**
- ★ **Intel® LANDesk Server Manager v2.5**
- 6 Expansion Slots: 3 PCI, 3 EISA
- 6 Drive Bays: 3 External 5.25"/3 Internal 3.5"
- 3 Year Warranty† with 1 Year Next-Business-Day, On-site Service
- 24x7 Dedicated Server Hardware Tech Support
- ★ **Buy before 9/30/96 and get factory installed Windows NT® Server 3.51 at no additional charge.**
- ★ ***Upgrade to 64MB ECC EDO memory, add $649.***
- ★ ***Upgrade to a 4GB Fast/Wide SCSI-2 hard drive, add $450.***

Lease: $130/Mo.
Order Code #250011

A NEW SERVER SO POWERFUL, IT CAN ACTUALLY BRING ITSELF IN UNDER BUDGET.

intel inside PENTIUM PRO PROCESSOR

MICROSOFT WINDOWS NT READY TO RUN

Dell introduces a new Pentium Pro processor-based server built from the ground up for the network applications and high volume resource-sharing your business demands.

The 180MHz PowerEdge 2100 features Ultra/Wide SCSI-3 support for wickedly fast read/write to its 2GB hard drive (which you can expand to 12GB). It's loaded with 32MB of high-speed ECC EDO memory which can be upgraded to a full 256MB. It also has Intel's LANDesk Server Manager v2.5. And it's Windows NT and Novell certified.

Best of all, it's backed by our award-winning on-site service‡ and 7 x 24 dedicated server tech support line. Call to order yours today. At a price like this you can't afford to wait.

simulation capabilities, network documentation, and bill of materials support. An advanced Boolean search engine helps you locate any database element.

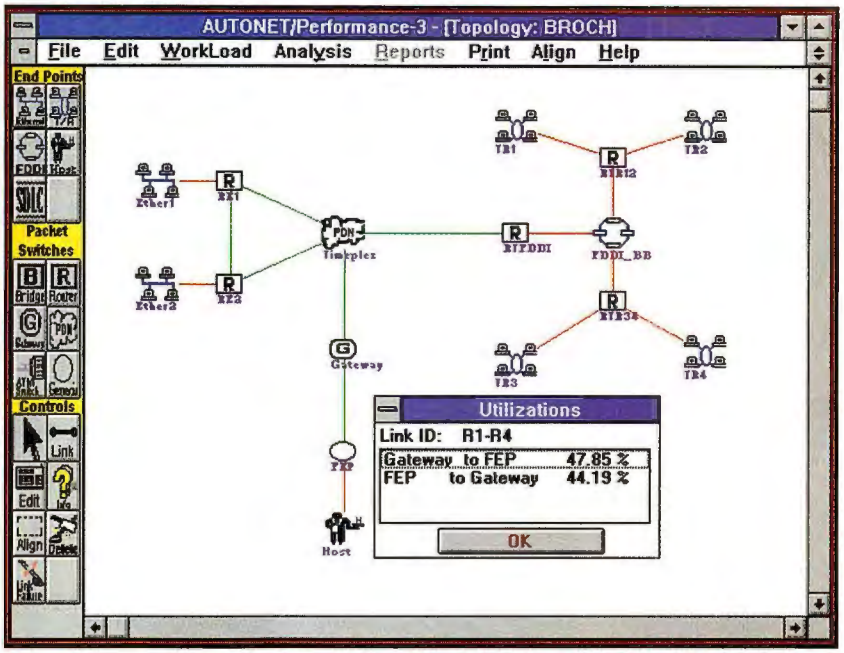
Web-Accessible Tools

The Web, besides extending help desk support, configuring and monitoring network devices, accessing network performance data, and enabling and disabling device operations, can also assist with network design.

NetSuite development tools help network professionals design and draw a mammoth network and publish their designs on the corporate intranet or the public Internet. Any authorized user can view them with a Web browser. NetSuite DesignView converts network designs and device details developed in NetSuite Professional Design into hyperlinked Hypertext Markup Language (HTML) documents with device configurations, port usage, and even device photographs. Users can easily navigate from device to device to trace connectivity and review device configurations. Besides supporting fault identification, the hyperlinked documents can be useful when you have to plan design changes.

Achieving specific design objectives requires properly configured equipment at each node. Calico Technology provides a product configurator that interconnect vendors can use to help their systems engineers, value-added resellers, and large customers accurately configure complex, built-to-order products such as routers and hubs.

Cabletron and Cisco are two of the companies that use the Calico Configurator. For example, authorized users can access Cisco's Configurator Agent page on the Web, search for configurable products, choose a particular model, and configure it. A Cisco 7000 backbone router, for example, can be configured for software options, power supply, power cables, memory, route and switch processors, and interface modules. Error messages flash on screen to indicate if you've picked a particular equipment configuration that's invalid, and suggestions help you pick the best configuration. The controls on the page allow you to then send the order to Cisco.



Network Design and Analysis's AutoNet/Performance-3 offers simple graphical design tools and analysis functions.

Not Quite Rome in a Day

In simpler days, network gurus kept information systems and networks operating smoothly with all configuration details tucked away in their gray matter. Today, systems are distributed and networks are going global. With intelligent hubs, switched LANs, sprawling router networks, broadband facilities, and advanced services like frame relay and ATM in the mix, large-scale networks are beyond mere human comprehension.

A new generation of intelligent design tools with built-in error detection, simulation and analysis, and plug-in function modules, has finally arrived. Managers and planners needn't be intimately familiar with every aspect of their networks. You can retrieve essential information instantly—often with point-and-click ease—then analyze, query, manipulate, and reanalyze that information if necessary. You can display the results in easy-to-understand graphics or export it for further study. Since products differ in the type and scope of data they provide, tools from different vendors may be necessary. Ultimately, the quality and completeness of the data determine the optimal network design.

With these powerful and intelligent new network design tools, you still may not be able to build Rome in a day. But you at least have a chance to build a solid foundation. B

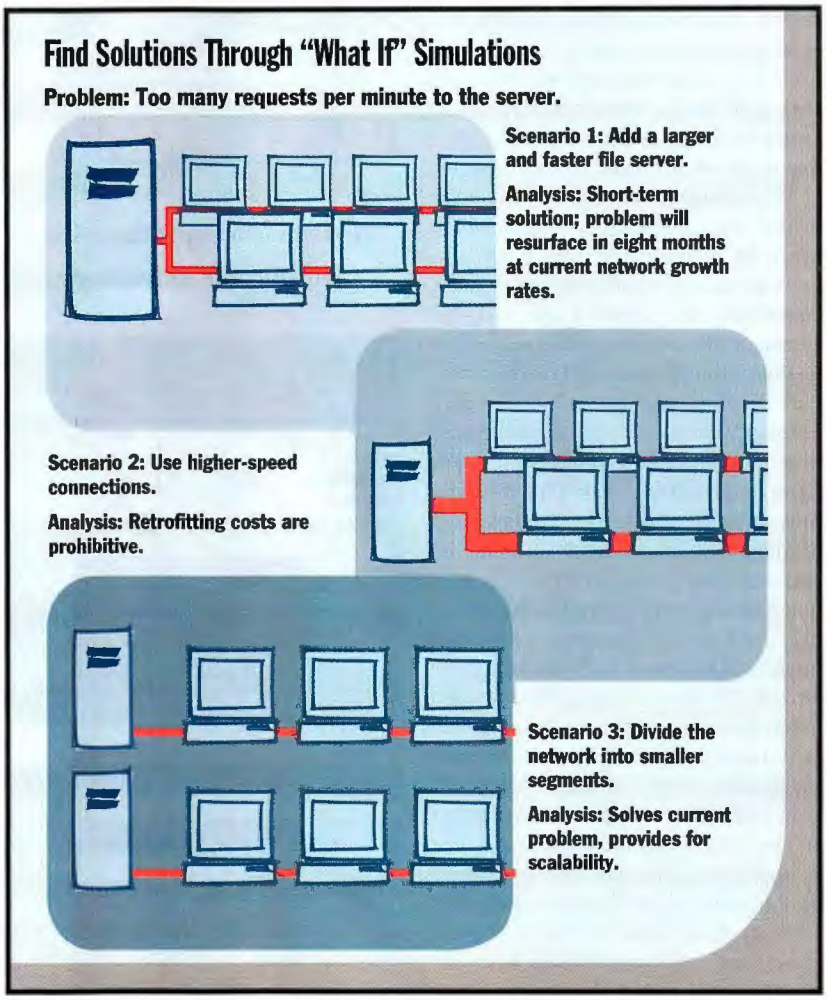
Commercial tools help system administrators manage traffic jams and avoid downtime. ***By Charles D. Knutson***

Building the Model Network

How do you efficiently design, build, grow, and manage huge networks without being able to automatically model and simulate them? Answer: not very easily.

Modeling is based on the existing large network. A good model can show you nooks and crannies, and their technical features, where you never even knew you had nooks and crannies. Modeling captures the network in a static or a dynamic snapshot for further analysis. What kind of analysis? Let's say you're considering new topologies. You might want one clear diagram of your until-now ad hoc accretion of network segments. You will probably also want to test aspects of network capabilities: Testing exercises network components to find their limits.

Simulation uses the network as a base, then goes off into the what-if world that's essential for planning. Naturally, designing large networks (see "Design and Conquer" on page 93) involves simulation, and maintaining networks (see "See the Big Picture" on page 107) involves testing. System administrators are in the tricky position of trying to satisfy everyone on their big network. Here are some automation tools that can help administrators deliver satisfaction.



One of the most valuable things about simulation tools is they let you try out different "what if" solutions to network problems.

Good Models Make Good Networks

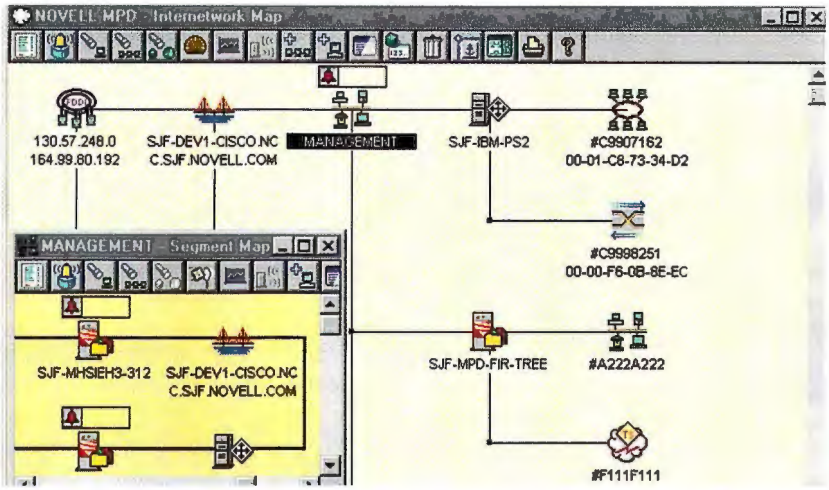
To manage a complex network and avoid system degradation and downtime, it's critical to have a view—a model—of what the network looks like. When big nets go down or slow down, companies lose big money. That's where a good model comes in. Like a road map when you're hopelessly lost and late, a detailed network model can simplify and speed solving network hang-ups. Without a detailed network model? You could be hosed before you know what hit you. As Bob Ross, president of LAN Utilities (Pleasant Grove, UT), developers of LAN test tools, says, "The self-perception of administrators is that they deal with problems within 20 minutes, but that's only after they find out about them."

Luckily, there are tools that can help create detailed and useful models of even the most arcane and far-flung nets. PinPoint Software continues to improve ClickNet, its network-diagramming product that allows administrators to customize graphic views of a network. It interfaces with network management packages (including Seagate's LAN Directory for Windows and McAfee's Saber LAN Workstation), can download information (about cable configurations; types of workstations, servers, hubs, and routers; and mission-critical software packages), and can automatically generate a graphic model of the network.

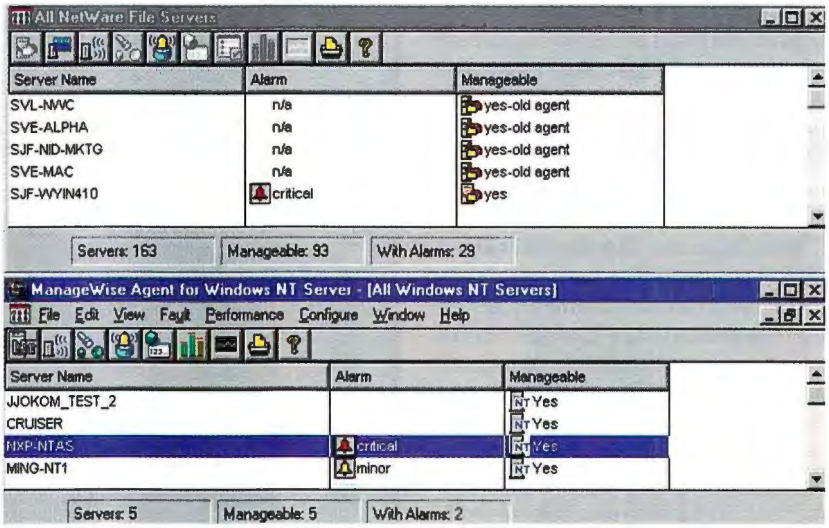
While Visio's Visio Technical 4.0 and Visio Shapes for Network Equipment may provide more powerful drawing capabilities—drag-and-drop diagramming, clean interface, and ease in aligning and moving objects without breaking

connections—they can't directly import information from network management packages. One of the more impressive and intelligent network-diagramming tools is Quyen Systems' netViz. Besides powerful drawing capabilities, netViz automatically discovers and displays information about nodes on a Novell network, identifying servers, workstations, and volumes. Automatic discovery does not rely on some earlier (and possibly out-of-date) database of network information. The larger the network, the more critical automatic discovery is for developing an accurate and useful model of that network for testing or simulation.

These diagramming tools ultimately deliver a static model of a system, which can help an administrator design and implement a network, understand the complexity of an existing one, and suggest areas that might become problematic. But nothing beats real-time information displayed graphically. Novell's ManageWise 2.1 allows administrators to model (and also manage) a network from a central location (the console runs under Windows 95 or Windows 3.1). ManageWise can discover and map all network devices and inventory the current hardware and software of workstations and servers, creating a dynamic model of the network. And not just for Novell's NetWare. ManageWise can also integrate with enterprise consoles such as IBM's System View for AIX, HP's OpenView, and Sun's Net Manager. The result is the ability to see at a glance when printers, servers, hubs, and routers die. Just as important, ManageWise tracks and displays network performance and warns when system behavior might suggest impending problems. ManageWise supports many snap-in applications, such as DenMac's Alert Pager, which immediately informs net supervisors of problems. That means an administrator on the golf course can receive a pager message with the news that a key server has died—unpleasant as golf rounds go but essential for limiting network downtime.



Novell's ManageWise 2.1 dynamically discovers and graphically displays all network devices for modeling and managing.



ManageWise also summarizes network configurations and sounds the alarm when system behavior goes awry.

Good Simulation Means Better Testing

A network simulation builds on a model, then brings it to life. Like a model train layout, a network simulation gets all the make-believe traffic moving, all the imitation lights blinking, and all the artificial crack-ups resulting. This is especially crucial with large networks, since no mere mortal can keep the whole conglomeration straight in his or her mind. With a good simulation, you can spot bottlenecks, buildups, and backups. Simulation is also a valuable basis for testing, since you can try things out on the simulator before flying the real fighter jet.

Unleashing new applications or new changes on an unsuspecting large-scale network can be disastrous. Developers especially face this problem. "That's one thing I've definitely found," says Ross. "In a development environment, usually you're fairly sequestered. It's usually not that busy of a network. So the engineers typically are developing on this quiet net, and then you throw the software onto a production environment and it goes berserk." New applications may also face mysterious and temperamental real-time problems—sneaky bugs that appear only at certain times of the day or under certain kinds of traffic loads. The hardest part of crushing these bugs is recreating them. To do that, the system administrator has to be able to replicate not just traffic volume but particular kinds of traffic.

So how do you adequately test a client/server application product that has never seen a really ugly network? Build your own ugly network! Chariot, from Ganymede Software, is a tool that can

simulate the traffic of client/server applications. Using Chariot, you can force a server to handle many concurrent requests from "clients" artificially made by the simulator—for a fraction of the cost of doing it live on multiple hardware platforms. CenterLine Software's QC/Sim has other nifty features for creating ugly environments in which to test distributed software. Operating as an add-on to QC/Coverage, a code-testing product, QC/Sim can fake scenarios that are difficult to replicate in practice, like network failures, limited disk capacity, and other real-life horror stories.

Bringing It All Together

In an ideal world, you would buy your whole network from a single vendor, with one perfect modeling and simulation product. But in reality, your huge network has probably snowballed until it seems to have a life of its own. "Larger organizations with multiple deployed offices don't go to Ford and buy," observes Bill Gillman, vice president of operations at Gentner Communications Corp. (Salt Lake City, UT), a manufacturer of telecommunications equipment. "They go to the store and pick some NAPA parts and some GM parts and some Ford parts, and they build their own custom car." As a result, the average system administrator has a nearly impossible task. You need a product that can, first, create a model of your patchwork network and, second, let you simulate what-ifs to that network. So what do you do?

You must zealously identify the tools that can grasp your network's complexities, then assemble those tools into a system that works. Large networks are built out of disparate hardware platforms, operating systems, and applications, and managing them is a daunting adventure. Without the right tools, it's downright impossible. B

The Answer in Power Protection

Circle 127 on Inquiry Card (RESELLERS: 128).

STORAGE NEEDS GETTING A LITTLE OUT OF HAND?

EXPAND WITH A DRIVE THAT EXPANDS WITH YOU.

- **Interlocking stackability**
- **1MB - 4GB disk capacities**
- **Fast-narrow and fast-wide**
- **4mm DAT, and 3.5" floppy device options**
- **8mm, CD-ROM, and QIC 5.25" options**
- **AC and SCSI jumpers replace external cables**
- **Optional LCD and keypad**
- **Optional hot plug removable drives, front removable power supply**
- **Supports Sun, HP, SGI, IBM, Mac and other PC platforms**

ARTECON introduces *Lynx* the new standard in SCSI peripheral technology. *Lynx* is a revolutionary mass storage subsystem, one that finally matches the technological advances of PCs, workstations and devices stride for stride. Ease of use and reliability are inherent in its visionary design.

Features such as interlocking stackability, external SCSI and AC jumpers, and internal printed circuit cards instead of SCSI cable are all standard. SCSI bus length can now be measured in inches rather than feet. And at an extremely compact size of 2.6"(H) x 6.75"(W) x 10"(D), *Lynx* will clean up your desktop too.

What's more, *Lynx*' basic value and performance is available at the same prices as so called 'standard' subsystems. A rich set of options includes front-panel LCD and keypad for disk information display and setting, true hot plug removability and a front removable power supply for ease of service.

Disk capacities range from 1MB to over 4GB in a single enclosure. And *Lynx* supports other 3.5" and 5.25" half-height devices too, such as tape, optical and floppy drives. All together, the *Lynx* family of subsystems represents the new standard in mass storage. Anything less is now sub-standard. Give us a call - we can help you get your mass storage needs back in hand.

Tracking thousands of users—and the related troubleshooting—can be made simpler with the right tools. ***By Tim Wilson***

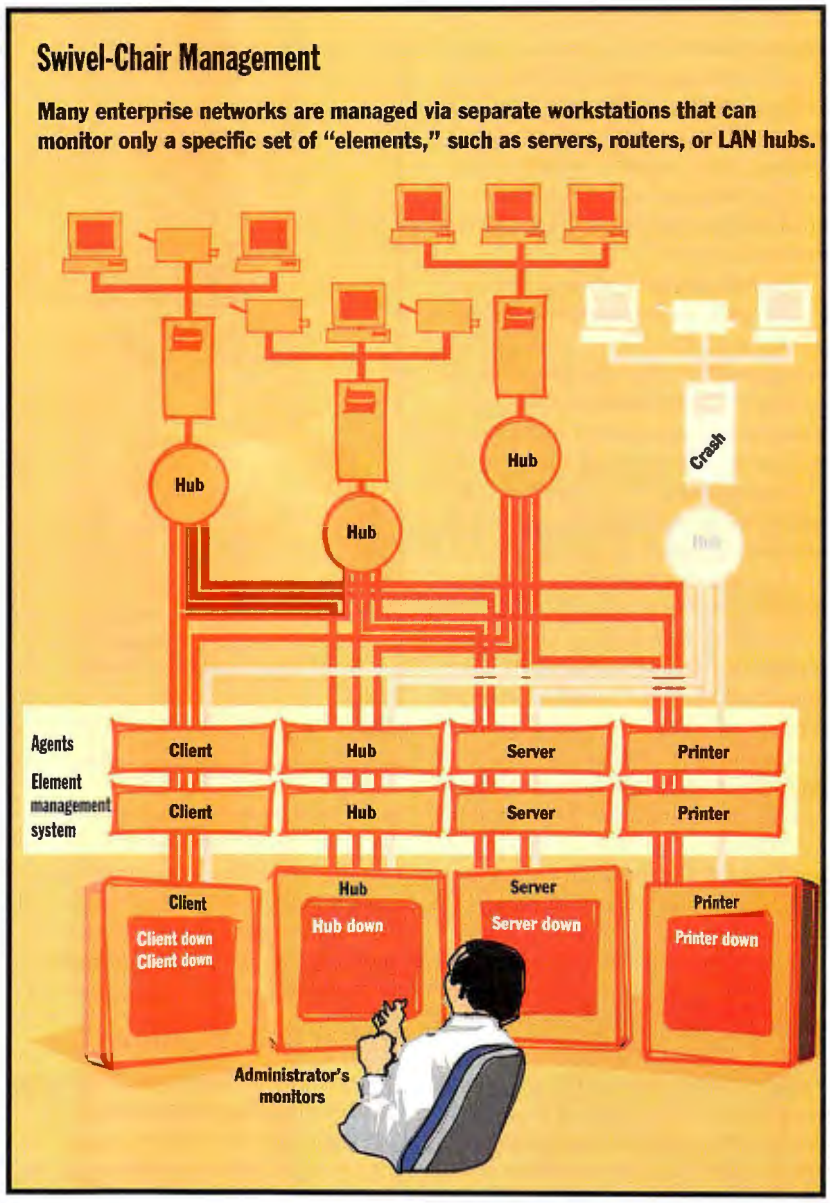
See the Big Picture

If you manage a large network, your job description is simple: Keep your organization's network up and running 24 hours a day, seven days a week, preferably at peak performance. Do a good job, and no one even knows you're there. But if the network crashes, it could cost your organization thousands, even millions, of dollars in lost business and productivity. And you could lose your job. (Gulp!) The task is much like piloting an airplane: hours of boredom punctuated by moments of sheer terror.

You can boil down your job description to a simple axiom: Uptime good, crash bad. That sounds simple enough. It's actually not too much different from managing a 10-node LAN, except that you can't use Norton Administrator to troubleshoot a 20,000-node network that spans 15 countries and includes everything from IBM mainframes to laptops and from multiprotocol routers to T1 multiplexers. For this job you need software with a little bit more power—what has now become known as an *enterprise management system*.

IBM, in the mainframe-oriented heyday of the 1980s, was the first company to develop an enterprise management system capable of monitoring and controlling networks consisting of thousands—even tens of thousands—of hosts and terminals. That software package, called NetView, opened up a new range of applications that ranks today as one of the data communications industry's hottest markets, which includes competitors from powerhouses such as Computer Associates, Digital Equipment, Hewlett-Packard, and Sun Microsystems.

This emerging range of enterprise management applications has changed significantly over the past decade, creating new capabilities that enable network administrators to monitor and control remote computers and other devices. But many managers of mega-networks, whose jobs are on the line, say the technology has not evolved rapidly enough for their liking.



Setting the Standard

The problem, MIS executives say, is that most so-called network management tools—such as Cisco's CiscoWorks and Novell's ManageWise—are designed to manage only particular devices or systems, such as routers and LANs, in the enterprise, not the entire network. These applications (collectively known as *element management systems*), which include modem, hub, and multiplexer management systems, gather data about the operating status of specific types of network devices (e.g., LAN servers, routers, and hubs) and display it on a Unix work-

station or PC monitored by the network administrator.

Element management systems typically are included with network devices, which means that the corporate network administrator who manages equipment purchased from many different vendors might have as many as 100 different consoles to monitor. This has created a need for "swivel-chair network management": the act of swiveling or rolling one's chair among many different consoles in an effort to locate the genesis of a network failure (see the figure "Swivel-Chair Management" on page 107). It's kind of like walking around with binoculars strapped to your head; you can see one focused area, but you can't step back and look at the whole picture.

Enter the enterprise management platform, usually a high-powered Unix-based workstation that can run many element management system applications simultaneously. The goal of the enterprise management platform is to provide a single workstation (or group of workstations) that can run many different element management applications and, ultimately, integrate the data from these applications to provide a "big picture" view of the entire enterprise network.

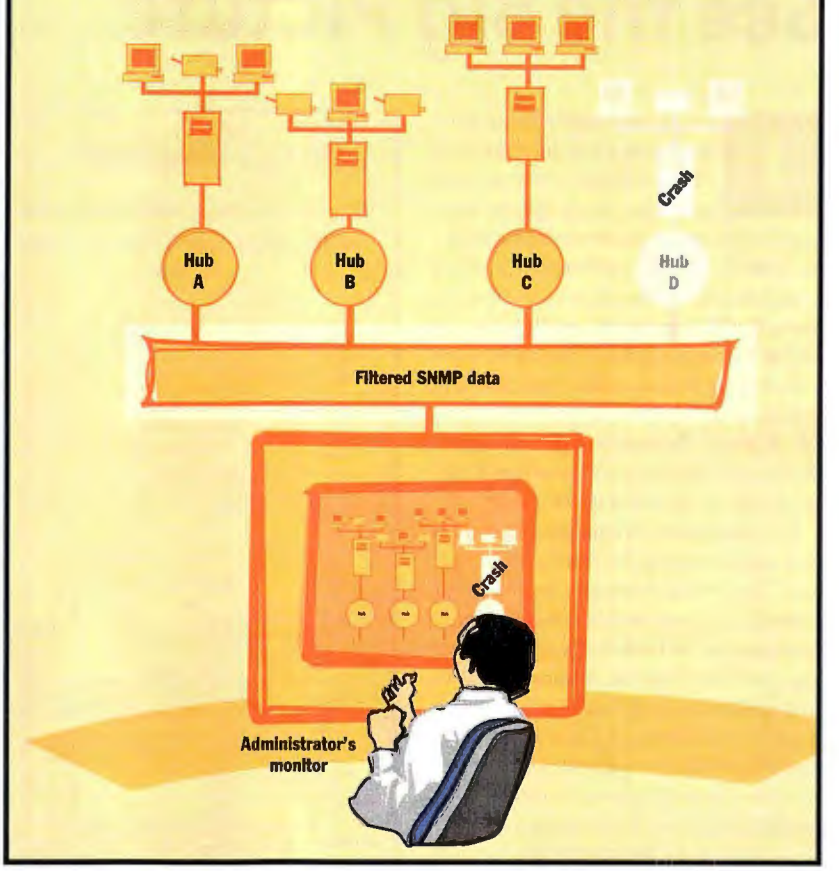
A good idea? Definitely. The problem is that not all element management systems speak the same language or report their status information in the same format. A standard protocol for transmitting and handling network management information is required. Most network devices today use SNMP, a standard published in 1992 by the Internet Engineering Task Force (IETF), the same body that sets guidelines for the Internet.

SNMP defines a method for collecting and formatting information about the devices to be managed through a small piece of software known as an *agent*. An SNMP agent can be installed on any intelligent device. Non-SNMP devices can be managed through *proxy agents* that translate any kind of status information sent to an intelligent agent.

Today, most network devices come with built-in SNMP agents that let them transmit status information to an SNMP-based management system. An administrator sitting at the console of one of the more popular SNMP-based enterprise management platforms, such as HP's OpenView and Sun's SunNet Manager, can gather and correlate data from a variety of SNMP-compliant devices and systems. This provides a broader view of the topology and status of the entire network (see the figure above). Most smaller networks do not require SNMP because they don't have the wide variety of hardware and software required in big networks.

Centralized SNMP Management

By "standardizing" on SNMP, large enterprises can build a hierarchical management system structure that lets them see the "big picture" at a central site.



Under Construction

Over the past several years, SNMP agents have been added to many network devices, and enterprise management platform vendors have been improving their products as they fight a pitched battle for industry leadership. Yet despite these steps forward, many corporate network administrators say they're still far from their goal of developing a common set of tools for enterprise management.

One problem is that many network elements still cannot be managed by SNMP. For example, most firms haven't scrapped their mainframes, which generally employ IBM's Systems Network Architecture (SNA) protocols. These SNA networks cannot be fully monitored via SNMP, which leaves huge blind spots in the network administrator's view of the enterprise. Similar problems occur at the LAN level, where companies such as Microsoft and Novell have only recently begun to deploy SNMP in their server products.

To complicate matters, many network administrators now find themselves responsible for managing not only the corporate network but also the hardware and software at the end of each link. Increasingly, systems and applications management are tied to network management, but only network devices typically have built-in SNMP agents.

In addition, many administrators have been disappointed thus far with the lackluster performance of SNMP-based enterprise management platforms. One of the most important problems is a lack of scal-

ability. Initial releases of several SNMP platforms—including offerings from HP, IBM, and Sun—were based on a single Unix server that couldn't share information with other management servers.

"In that world, you could see the entire environment, but only if it was small," explains Andy Vanagunas, product manager for HP OpenView. "In the larger environments, it was a little like driving with your windshield half-covered."

Under these limitations, the so-called enterprise management platforms could realistically manage only around 1000 nodes—only a slight improvement over some higher-powered LAN management systems. Although some vendors—notably Cabletron Systems, Groupe Bull, and HP—have fixed this problem to provide high scalability in current releases, many potential buyers are still stinging from the failure of those early releases to meet their high expectations.

Another deficiency in many currently available enterprise management platforms is the absence of communication between element management applications running on the same platform. While administrators may have reduced the number of consoles to be monitored, they still must correlate in their heads the data gathered by multiple applications.

For example, a router failure on a network might terminate communications with 100 systems attached downstream from that router. Sitting at the SNMP enterprise management console, the network administrator is suddenly swamped with 101 alarms that indicate a system failure. Yet only one is the cause of the problem; the other 100 are only symptoms. In many cases, it's left to the network administrator to determine which is which.

This problem has created a niche market for management software that can correlate network events and present the administrator with root-cause information. This correlation can take place in one of two ways: through filtering, which eliminates event data that's downstream from the root problem; or through true correlation, in which data from several different applications is intelligently reviewed and processed to determine the interrelationship between separate network events.

Although event correlation is still a fairly new idea, a number of related products have been on the market for several years. Seagate, for example, offers a package called NerveCenter that correlates SNMP events; other suppliers, such as Boole & Babbage, Maxm, and Objective Systems Integrators, sell products that focus on the correlation of events in non-SNMP legacy environments as well.

Sometimes the lack of data integration between management applications creates difficulties in pinpointing the origin of a network problem. For instance, the router might indicate that a problem is caused by an overflow of data from a particular server; meanwhile, the server may indicate that the problem is in the router. This situation, sometimes called *finger-pointing*, is a common complaint of enterprise management platform users.

Many enterprise management platform vendors hope to solve the finger-pointing problem by rebuilding their network management applications using object-oriented technology. This capability, which is already in development at companies such as Groupe Bull and IBM/Tivoli, will let users share data across multiple applications, in much the same way

Tornado Touches Down

The oldest and best-known Unix-based enterprise manager on the market today is Hewlett-Packard's OpenView, which was introduced in 1990. OpenView uses the industry-standard SNMP protocol to gather data from multiple network elements via many different network management applications that run on a common workstation.

In 1993, HP began working on a new version of OpenView that was designed to manage very large networks through the distributed interconnection of multiple OpenView servers. This new version, code-named Tornado, was HP's answer to OpenView's limitations. At that time, the software could manage a maximum of only about 1000 nodes.

Development problems caused the delivery of Tornado to be delayed more than a year, but last year HP shipped an initial release that expanded the system's ability to process management data as well as increase the number of operators that could work from one OpenView server. However, Tornado 1 didn't provide the distributed capabilities required in the largest corporate networks.

In March, HP unveiled the Tornado 2 release of OpenView, which offers much-expanded distributed management capabilities. Tornado 2, officially designated HP OpenView Network Node Manager 4.1, lets managers use multiple Unix workstations to gather information about networks of 10,000 nodes or more. In the fall, HP will deliver the same software on a Windows NT platform.

The new release of OpenView also includes a new management tool, called OpenView Workgroup Node Manager, which is designed to manage smaller workgroups or departmental networks. The workgroup management tool, which also runs on Unix or NT, can interface with Network Node Manager 4.1, enabling users to handle some management tasks locally without giving up the ability to pass some management information to an enterprise management platform in the central network-control center.

HP OpenView Network Node Manager 4.1 lets multiple Unix and Windows NT workstations monitor networks with thousands of nodes.

that users of the Microsoft Office suite can share information across Word, Excel, and PowerPoint via OLE.

User Approaches

Besides dealing with the deficiencies of technology and tools, corporate network managers must also face the grim reality that no two organizations, or their networks, are alike. Therefore, the method of implementing enterprise network management platforms might differ significantly from company to company.

Some firms, particularly long-established IBM mainframe shops, have a central data center that controls most of the data network management functions in the enterprise. These organizations prefer a central point of control for monitoring all network activity, such as what the mainframe-based NetView provided in past years. This allows all troubleshooting, as well as other administrative tasks, to be handled by a centralized group of people and software.

In today's client/server multivendor environment, this centralized method of control can even be applied to the use of SNMP-based enterprise management systems. The network manager might divide the enterprise into multiple management domains—based on geography, applications, or traffic type—each managed by local SNMP platforms. These local platforms would all be connected to a single, central platform that collects filtered data to create a high-level view of the entire enterprise.

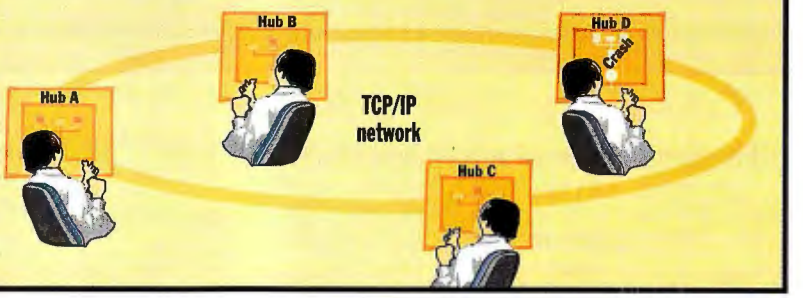
However, the proliferation of client/server technology, as well as the decentralization of many large businesses, is making centralized management increasingly difficult. In many large enterprises, network management and administration decisions are made at a departmental or business-unit level. The central MIS manager is responsible for coordinating these distributed activities—as well as distributed multivendor tools and personnel—across the enterprise.

Unfortunately, there are no universal truths as to whether centralized or distributed approaches work best in the very largest networks. The decision to use centralized or distributed network management is much like the decision between centralized and distributed personnel management; how you do it depends largely on how the organization operates.

SNMP-based enterprise management platforms were designed to function in distributed environments, collecting data in many different formats across many different domains (see the figure above). But, as previously mentioned, the lack of server-to-server communications capability in many SNMP platforms has made this approach hard to implement, since this capability is a prerequisite for scalability in very large network environments.

Distributed SNMP Management

By interconnecting all the SNMP "servers," network administrators manage pieces of a large enterprise. This approach expands the scalability of management systems and decreases reliance on a central workstation.



Whether centralized or distributed, it seems that today's enterprise management platforms have barely scratched the surface of the data they will eventually have to manage. In large organizations, the network management system is rapidly becoming the point at which the pulse is taken for the entire IS environment.

For example, many enterprise management platform vendors are adding systems management capabilities to their network management platforms. These capabilities let an administrator monitor hardware parameters, such as I/O performance, response times, and storage utilization, as well as the performance of the network. In fact, some products, such as HP's IT/OperationsCenter and IBM's SystemView, actually subordinate the network management function to a higher-level system management function.

Large organizations have recently taken this evolution a step further by focusing on enterprise applications management. Administrators employ systems and network management tools only to support the end game of ensuring that specific mission-critical applications are available and are performing well. This approach makes sense to CEOs and end users, who seldom have a great deal of knowledge of network or systems management but know when their applications are not performing as they should.

The addition of systems and applications management functions threatens to completely overwhelm today's enterprise management platforms, which have already proven to be deficient in handling network-specific data alone. How will these platforms be able to keep up?

One development that will help is the recent improvement in SNMP platform scalability. Several of the industry's leading platforms, including HP's OpenView and Cabletron's Spectrum, are now delivering server-to-server distribution capabilities that should enable them to scale to infinitely large networks. The ability of these systems to handle network and systems information—even in environments of 10,000 nodes or more—is improving significantly.

Object-oriented technology may make it easier for applications running on the same platform to share data. Companies such as IBM/Tivoli are advancing new object-oriented frameworks for building management tools; this should result in improved integration. Vendors are also integrating event correlation, rules-based reasoning, and even AI into network management systems to reduce reliance on human operation and make network administrators more productive.

Will tomorrow's enterprise management systems replace the human network administrator? Not in our lifetimes. But with new technology, administrators may be treated to a little more boredom and a lot less terror. B

Tim Wilson is a senior consultant at Decisys, Inc., an enterprise network consulting firm based in Sterling, Virginia. You can reach him at **twilson@decisys.com.**

First Desktop RAID for SPARC™

RD10

RAID Storage Subsystem

Features

- High Availability
- True RAID data integrity
- Fast throughput-17mb/sec
- Up to 25.2GB storage
- SPARC/SUN pizza box form factor
- Easy to use GUI

When you need your data safe, reliable, and ready, the Integrix RD10 delivers high performance with low cost per Mbyte.

Thanks to a dedicated 33MHz RISC processor and enhanced RAID technology, combined with dedicated I/O processors for each drive and host, the RD10 reaches throughput speeds in excess of 17Mbytes/sec. For high availability environments, dual fast/wide SCSI ports make your data available to two hosts simultaneously.

Five different hardware RAID levels, hot spare disks, and hot-swappable drives keep your data safe and secure. Data automatically and transparently rebuilds on the spare drive eliminating downtime and data loss. Data integrity is assured for all mission-critical applications.

The RD10 Graphical User Interface eliminates the need to type obscure commands found buried in the back of a service manual. Historical performance software analyzes and fine tunes your RAID. Configuration and firmware upgrades can be handled automatically. RD10 status and context-sensitive online help are made instantly available. All with the click of a mouse button.

RD10 RAID Throughput Performance

(5400rpm F/W SCSI-2 HDD)	Mbytes/sec	IOs/sec
Sequential Read (max)	16.8	1307
Sequential Write (max)	17.2	1247
Random Read (max)	9.9	620
Random Write (max)	13.0	357

RD10 RAID Subsystem Specifications

RAID Levels Supported	0, 1, 3, 5, 6, (0+1)
Processor	33MHz 32bit RISC
Cache Memory	8Mbytes to 128Mbytes
Channels	2 host channels
	6 disk channels
Disks Supported	3.5", 1" high
	SCA-2 or 68-pin connector
	Fast/wide Single Ended SCSI-2 interface

RD10 RAID Storage Subsystem

Compatible with Solaris and Windows NT

19 Pentium Portables Do Multimedia

With Pentium processors, gigabytes of drive space, large screens, and CD-ROM drives, these notebooks are more than ready for prime time.

By Maggi Bender, Jim Kane, and John McDonough

When it comes to work, today's multimedia notebooks certainly let you take it with you. Running Pentium processors at rates of up to 166 MHz, today's multimedia notebooks might not be as fast as the top Pentium and Pentium Pro desktop systems, but they make good business computers, both on the road and in the office. These high-end Pentium notebooks are also expensive, being almost twice the cost of comparably configured desktop systems. However, with accelerated graphics, large active-matrix color displays, CD-ROM drives, and 810-MB or larger hard drives, they provide full-throttle computing for on-the-go professionals.

We tested 18 Pentium portables that range in price from $3000 to almost $7000 and employ 100-, 133-, or 166-MHz CPUs. We also included Canon's AMD 5x86–powered Innova Book 360CD (see the text box "AMD Inside" on page 123), which provides Pentium performance. You can buy a more economical 486DX4-based notebook, but you'll want a Pentium to handle graphics-intensive multimedia tasks under Windows 95 or OS/2 Warp—and to delay your next upgrade cycle.

Modular components have become a hot notebook feature. Many high-end notebooks we test here provide an all-purpose bay that can hold a CD-ROM player, a floppy drive, or an additional battery. You swap them in and out depending on what you need. You can't use floppy and CD-ROM drives simultaneously, but the modular design saves space, weight, and battery power while maintaining desktop functionality. We included two ultrathin systems—Digital Equipment's HiNote Ultra II and the Impulse Duonote—because they have attachable multimedia bases for CD-ROM and stereo-sound functionality, another form of modularity.

Most of the portables we tested have removable hard drives, a feature that ensures upgradability. Even the 2.1-GB hard drive in Micro-International's Mint 5200 may seem small in a year or two. Most notebooks have two Type II PC Card slots and infrared ports for cable-less file transfers. The Toshiba and NEC units implement the new 4-Mbps IrDA 1.1 infrared standard.

BYTE BEST
PENTIUM PORTABLES

NEC Versa 6030H
offers chart-topping performance, numerous portability features, and excellent ease of use.

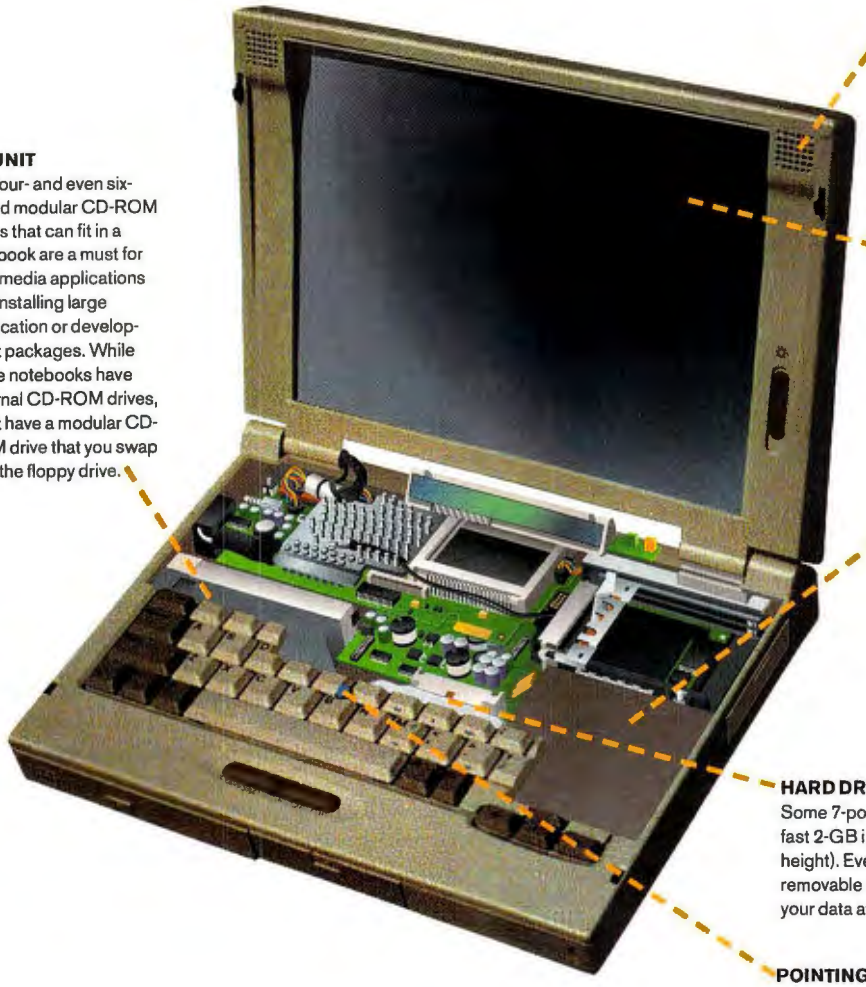
All test notebooks came with active-matrix screens that display graphics with crisp details and deeply saturated colors. With three 10.4-inch exceptions, the high-end notebooks we reviewed have either 11.3- or 12.1-inch SVGA displays. All can display at 800- by 600-pixel resolution, which is great for Windows 95, but you'll want a big display and one with a wide horizontal viewing angle if you routinely use your notebook with a handful of people sitting around a table. The 12.1-inch panels provide roughly the same viewable screen real estate as a 14-inch desktop monitor.

Less expensive passive-matrix displays are still an option with most of these products, but the trend is toward the bigger, brighter, more responsive active-matrix displays. IBM, for instance, dropped its ThinkPad 550 with the pop-open butterfly keyboard so it could add more screen real estate, and Toshiba's cutting-edge Tecra 730CDT supports an unusual 1024- by 768-pixel resolution on its 12.1-inch screen (we reviewed the Tecra 500CDT).

Those notebooks costing more than $5000 are from big-name vendors such as Compaq, Gateway 2000, IBM, and NEC Technologies. Compared to less expensive units, they come with more software and longer warranties. A unit such as IBM's ThinkPad 760ED, for instance, has multimedia luxuries: a 64-bit graphics chip with 2 MB of dual-ported video memory, hardware-assisted MPEG playback, an internal 28.8-Kbps data/fax/telephony modem, and lithium-ion batteries that outlast nickel-metal-hydride (NiMH) batteries in our battery run-down tests.

Such feature-laden portables use battery power quickly. We suggest that you get a notebook that can hold multiple lithium-ion batteries if you want to work throughout a cross-country plane flight.

The two 166-MHz notebooks we tested turned out not to be the fastest. In spite of 256-KB Level 2 caches, the Chem Book 5580 and the Micro-International Mint 5200 didn't perform as well as the 133-MHz NEC Versa 6030H. Typically, a 166-MHz Pentium system should perform 10 percent faster than a 133-MHz system. The Mint 5200 suffered from below-average memory performance and slow hard drive and CD-ROM drive speed. The



CD UNIT
The four- and even six-speed modular CD-ROM drives that can fit in a notebook are a must for multimedia applications and installing large application or development packages. While some notebooks have external CD-ROM drives, most have a modular CD-ROM drive that you swap with the floppy drive.

STEREO SPEAKERS
Though they typically don't provide the greatest sound quality, a pair of integrated stereo speakers and 16-bit Sound Blaster Pro sound are good enough for most multimedia presentations, games, and telephony.

LCDs
Multimedia notebooks with 11.3- or 12.1-inch active-matrix color displays provide crisp viewing at 800- by 600-pixel resolution. Lots of video memory and a hardware MPEG decoder help some systems display TV-quality, screen-filling video.

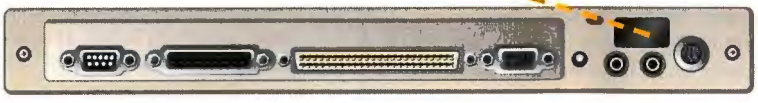
INTERNAL BATTERY
Most notebook vendors have made the transition from nickel-metal-hydride (NiMH) batteries to lithium-ion battery packs. Although they're costlier, lithium-ion batteries lasted longer in our battery run-down tests. They also provide more charging cycles than NiMH batteries.

HARD DRIVE
Some 7-pound computers now support a fast 2-GB internal hard drive (19-mm height). Even better, most notebooks have removable drives for upgrading or securing your data at night.

POINTING DEVICE
Everybody has a preference when it comes to pointing devices. Judging from the units we tested, touchpads and eraser-like pointing sticks are in, while trackballs are out.

IrDA INTERFACE
Infrared technology lets you transfer files to another system or send print commands without cables to IrDA-equipped printers. Most notebooks transmit at 115.2 Kbps. Toshiba's Tecra 500CDT supports the new 4-Mbps Fast-IR IrDA 1.1 specification, as does the NEC Versa 6030H.

Rear View



Chem Book 5580 was hurt by poor memory and hard drive performance.

For multimedia, software development, or just to load large applications, a notebook must have a built-in CD-ROM drive. We recommend that you get one with a four- or six-speed CD-ROM drive for faster read and seek times. Multimedia notebooks must also have integrated stereo speakers, though a small speaker size limits its sound quality.

Notebooks that come with hardware-assisted MPEG—the Compaq LTE 5300, NEC Versa 6030H, Nimantics Quanta 6x 133, Impulse Duonote, and IBM ThinkPad 760ED—can effectively zoom video clips to full-screen without the dropped frames and blocky pixellation associated with software-only MPEG. Having 1 or 2 MB of dedicated video memory and a PCI-bus architecture also helps to enhance graphics I/O performance.

Toshiba's Tecra 500CDT has a Zoomed Port Video (ZPV) PC Card slot. The proposed ZPV standard establishes direct communication between the PC Card controller and the audio and video controllers, so that large amounts of multimedia data don't require processing through the CPU or system bus. When ZPV cards become widely available, the Tecra 500CDT will provide a fast connection for full-motion video playback. The Tecra 500CDT and NEC's Versa 6030H also support CardBus, another proposed standard. This standard provides for 32-bit PC Card peripherals such as Fast Ethernet and Fast SCSI adapters.

Best Overall

PENTIUM PORTABLES

Almost every desktop maker now has a portable for sale, and the market is stratifying with notebooks at different price/performance levels. Higher-priced Pentium notebooks are heavy on cutting-edge components, while value systems are capable but lack such advanced features as hardware-assisted MPEG playback. For this reason, we rated the notebooks in three categories: best-overall portable, best desktop replacement, and best low-cost notebook (under $4000).

Best Overall

We chose the well-rounded NEC Versa 6030H as the best-overall notebook. It has fast performance, a multitude of portability features, and a high ease-of-use rating. While the Versa 6030H is a hot multimedia notebook, several other models weren't far behind in our best-overall ranking.

Shadowing the Versa 6030H was the WinBook FX (our pick for best low-cost system; see below). Toshiba's 8.2-pound Tecra 500CDT also did well. The $4999 unit provides many leading-edge features, including Zoomed Port Video (ZPV) and CardBus support, as well as 4-Mbps IrDA capability. With a 120-MHz Pentium, it performed better than many units with 133-MHz processors, and it placed in the top five for battery life.

Impulse Computer may not be familiar to many users, but its Duonote made a big splash in our Lab Report. It's a moderately priced multimedia notebook ($4699) with a nice modular design. Compaq's $6398 LTE 5300 is a 7.4-pound lightweight that also placed in the top five. The highly modular system scores high in features (right behind the IBM ThinkPad 760ED and Hewlett-Packard's OmniBook 5500 CTS) and also in usability, because Compaq supplies a three-year warranty and 24-hour, toll-free technical support. (An even more modular model that wasn't ready in time for this roundup, the Compaq Armada 4100, is reviewed in "Notebook Under Construction" on page 154.)

Best Desktop Replacement

Several notebooks in this roundup beg the question: "Do I really need that desk-stealing power hog back in my cubicle?" Not only do these systems provide excellent docking options, the best desktop-replacement systems run fast and furious in our performance benchmarks, providing desktop-level performance. NEC's Versa 6030H, our best-overall pick, is again the winner, but some strong runners-up are Toshiba's Tecra 550CDT and Compaq's LTE 5300.

The 7.5-pound Nimantics Quanta 6x 133 is an affordably priced ($3999) multimedia notebook with high-end functionality. It has a 12.1-inch SVGA display, a voluminous 2.1-GB hard drive, and an efficient lithium-ion battery that lasts 2 hours and 37 minutes in our tests.

HP's OmniBook 5500 CTS ($6120) costs much more than the Quanta 6x 133, but it's a premium notebook for making presentations with its wide-angle 12.1-inch SVGA display.

Best Low Cost

It's quite a stretch to call any multimedia notebook a low-cost product, but some are easier on the credit card than others. We drew a low-budget line in the sand at $4000, which left us with nine notebooks. The WinBook FX is our low-cost winner. It had high all-around scores and did particularly well in usability. Nimantics' Quanta 6x 133 took the number-two spot, followed closely by Texas Instruments' 100-MHz Extensa 570 CDT.

Dell's Latitude LM P-133ST had the best battery life of all the test units. Its lithium-ion battery and effective power management scheme kept it going for 3 hours and 41 minutes in our battery rundown test. We must also give battery-life honorable mentions to the Gateway Solo S5-133 (3:31) and IBM's ThinkPad 760ED (3:24), which both also use lithium-ion batteries (but aren't low-cost portables).

The 6.1-pound TravelPro 1900 ($3695), from AMS Tech, is a top-quality multimedia portable with a 133-MHz Pentium, a 12.1-inch SVGA display, a 1.3-GB hard drive, and a three-year warranty—components and support you would expect from a higher-priced notebook.

TECH FOCUS: HEAT CONTROL

Taking the Heat

Heat is the limiting factor in getting high-end desktop performance out of a portable computer. The more heat a notebook design can dissipate, the faster you can reliably run the CPU or the more memory you can hold. Fan-induced convection cools most desktop systems, but fans are unacceptable in notebooks—they're noisy, power-consuming, and a potential failure point. Convection also needs space for air to move, something compact notebook designs lack.

Good notebook designs rely instead on passive conduction. Heat is conducted away from the CPU, hard drive, and the graphics subsystem to exterior surfaces capable of radiating heat. The keyboard, the I/O port area, and (if it's not a docking unit) the bottom surface of the notebook (that isn't blocked by the battery) are all good surfaces for dissipating heat.

An aluminum heat sink will quickly draw heat away from the CPU, but the heat must then be conducted to the outside. Typically, metal sheets or frame elements, often made of a lightweight, conductive magnesium alloy, serve this purpose. Compaq's Armada 4100 series, for example, has a magnesium chassis that provides structural stiffness to the notebook, a path for outward heat conduction, and external radiation surfaces. Tadpole's notebooks can handle the latest desktop processors because they have a magnesium-alloy case that is thermally connected to the CPU.

Some designs use heat pipes to beef up thermal conduction by metal plates. These small-diameter sealed metal tubes contain a liquid that wicks from one end of the tube to the other, driven by a thermally induced fluid-to-vapor cycle. The pipe serves as a passive but effective heat pump.

Do more with less.

Most operating systems leave little room for important things. Like your application.

With the QNX realtime OS you'll pack more functionality into less memory. Achieve more performance with less-expensive CPUs. And deliver better solutions at a lower price.

Better yet, QNX supports more PC hardware than any other realtime OS. Whether it's PC/104 or PCMCIA, embedded X86 or the Pentium® Pro, QNX lets you use it right out of the box. Get to run time in less time!

More scalable than ever! From low-end to high-end, QNX offers you the ultimate in scalability. Even your deeply embedded systems can boast a scalable POSIX RTOS, thanks to our new, exceptionally small Neutrino™ microkernel.

And if you need to add the capabilities of a high-end GUI to your low-end system, you can. Our award-winning Photon microGUI™ gives you a phenomenal front end, with enough memory left over for important things . . . like your application!

What is nStor?

Manageable Fault-Tolerant Storage

Lasting quality and reliability are built into every *n*Stor RAID system. From the easy-to-use Alert Manager software to the redundant hot swap components, data integrity is our first priority. *n*Stor systems are the first to incorporate the SAF-TE (SCSI Accessed Fault-Tolerant Enclosures) standard which is leading-edge technology to protect your investment. In addition, *n*Stor utilities provide unmatched manageability which allows you to switch RAID levels or capacity on-the-fly. You can also configure a hot spare for automatic data reconstruction without user intervention. So whether you're looking for manageability or reliability *n*Stor RAID systems meet your needs. *n*Stor systems support RAID levels 0, 1, 3, 5 and are compatible with FAST WIDE SCSI. Call for more information or visit us on the web at **http://www.nstor.com/**

LAB RESULTS

PENTIUM PORTABLES RATINGS

BEST OVERALL

NEC Technologies Versa 6030H

The Versa 6030H ($5799) is our best-overall portable Pentium because it is fast, feature-packed, and easy to use. The 9.5-pound unit races through our benchmarks with a 133-MHz Pentium processor, 256 KB of synchronous pipeline cache memory, a PCI bus, and 2 MB of video memory. The Versa 6030H is a strong multimedia machine with hardware-accelerated MPEG for full-motion, full-screen video playback; a six-speed CD-ROM drive for fast data transfers; and excellent 16-bit stereo sound. The system also has a healthy bundle of applications and telephony features for those who need to keep in touch with the office.

WEIGHTING

	PRICE	TECHNOLOGY	IMPLEMENTATION	PERFORMANCE	FEATURES	USABILITY	BATTERY	OVERALL RATING
NEC Versa 6030H	**$5799**	★★★★	★★★★	★★★★★	★★★★	★★★★★	★★★	★★★★
WinBook FX	$3999	★★★★	★★★★	★★★★	★★★★	★★★★★	★★★	★★★★
Toshiba Tecra 500CDT	$4999	★★★★	★★★★	★★★★	★★★★	★★★★★	★★★★	★★★★
Impulse Duonote	$4699	★★★★	★★★★	★★★★	★★★★	★★★★	★★★	★★★★
Compaq LTE 5300	$6398	★★★★	★★★★	★★★★	★★★★	★★★★	★★	★★★★

BEST DESKTOP REPLACEMENT

NEC Technologies Versa 6030H

With its strong performance score, the Versa 6030H is also our choice for best desktop replacement. It is not only efficient but flexible with its easily accessible Versabay II, which supports a floppy drive, an extra hard drive, an extra battery, or the CD-ROM drive. For an extra $799, NEC offers even more desktop functionality with its Docking Station 6000, which has three expansion-card slots, three drive bays, built-in speakers, four audio ports, and an RJ-11 phone jack.

WEIGHTING

HP OmniBook 5500 CTS	$6120	★★★★	★★★★	★★★	★★★★★	★★★★	★★	★★★★

LOW COST

WinBook FX

You don't have to pay $6000 for a multimedia notebook. The WinBook FX goes for $3999 and sacrifices little. With a 133-MHz Pentium, 16 MB of RAM, and 1 MB of video memory, the WinBook FX does admirably in our performance benchmarks. The 6.8-pound laptop has an 11.3-inch SVGA display, Sound Blaster Pro–compatible sound, a 1.3-GB hard drive, and a lithium-ion battery that lasts 2 hours and 38 minutes in our Thumper II run-down test.

Details

Ultracool Design

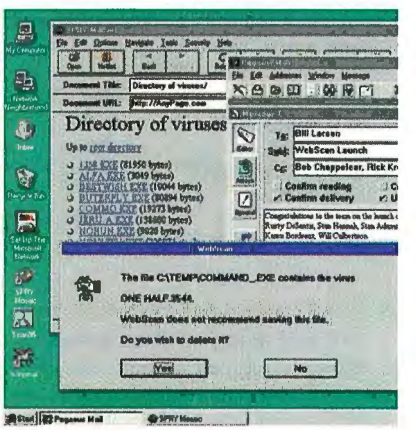
If you find most notebook designs boringly similar, check out Digital Equipment's HiNote Ultra II. Its sleek, angled chassis should turn the head of any individualist. The HiNote Ultra II has a lithium-ion battery that clips onto the rear and two attachable base modules: One is a thin wedge with a floppy drive, while the larger multimedia base provides speakers and a CD-ROM drive. Do you think Compaq found inspiration here for its new Armada 4100?

Making Your Point

Users can often choose from many different peripherals when buying a notebook, but the pointing device usually isn't one of them. The WinBook FX comes standard with a pointing stick between the *G*, *H*, and *B* keys. For an extra $80, however, you can opt for a dual-button touchpad.

NEC's Bug Barrier

NEC's Versa 6030H has two hot-loaded McAfee antivirus software packages—VirusScan and WebScan—that guard the system from known viruses and provide virus protection for the most popular Internet services, Web browsers, and e-mail.



Up Against the Wall

Hooking a 17-inch monitor to a notebook is a cost-effective way to make a presentation to a small group of people sitting around a table. For larger groups, however, you need projection. You can buy an LCD panel that sits on an overhead projector or a self-contained projection unit. In either case, your notebook drives the display. Wedge Technology's ShowBiz 5000P ($4799) provides another option.

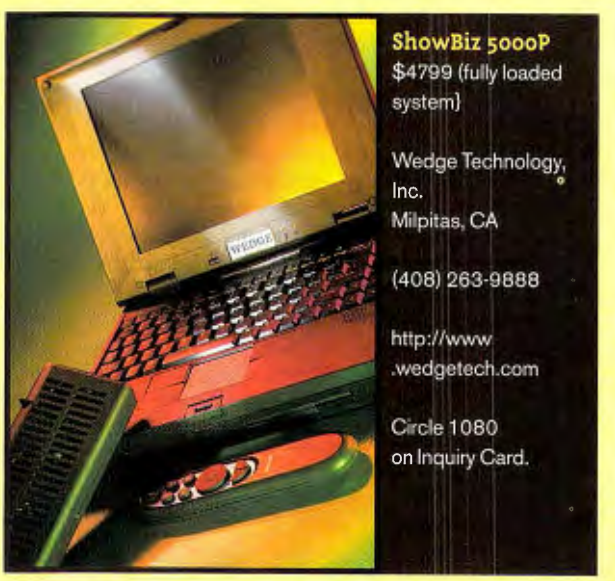
The ShowBiz 5000P is a Pentium notebook with an LCD that converts into an overhead projection panel. Like a few projection notebooks before it (see "Presentation Quality," September 1995 BYTE), the ShowBiz 5000P lets you make large-room presentations at any office with an overhead projector. While the ShowBiz 5000P is best for software demonstrations, Wedge also offers optional MPEG playback and TV cards, so you can project videos 6 feet high on a screen.

We found the LCD projection panel easy to set up. After removing a protective back panel from behind the ShowBiz 5000P's 10.4-inch active-matrix display, you place the LCD panel on an overhead projector. A support tray for the notebook itself attaches to the projector. The display supports 800- by 600-pixel resolutions at 65,536 colors. The unit comes with a cooling fan that connects to the LCD panel to dissipate the heat from the projector's lamp.

Though the projected images are not as bright as on some desktop projectors (see "Road-Show Romance" on page 55), we found the images to be clear and well defined when shown in a fairly dark room. It takes some adjustment of the LCD projection panel to eliminate ambient light from the overhead projector, but that should not be a problem after you get used to setting it up.

The notebook sits directly in the path of the overhead projector, so Wedge supplies an infrared-attached remote-control device so the presenter can control the PC. Mind Path's Presentation F/X software lets you move the mouse around the display and zoom in on different areas of the screen.

—John McDonough



RUGGED PORTABLES WITH LOTS OF SLOTS

Dolch Computer Systems builds portable computers for industrial and military applications that must withstand the rigors of rough treatment and harsh environments — demanding massive expansion capability and the performance of a high-end desktop.

Grit, Grime and Water Proof

Dolch builds the world's toughest portables for sophisticated military and industrial users.

- ❑ Tested to Military and NEMA Standards — Shock to 50Gs
- ❑ Completely Sealed Systems — NotePAC™ Runs in the Rain
- ❑ Add-in Protection — Unique Card Retention System

Massive Expansion

The PAC™, L-PAC™ (Light-PAC) and NotePAC families offer a wide variety of slot and drive specifications. Systems can be tailored to precisely match the application requirements.

- ❑ From 1 to 7 Expansion Slots — ISA, EISA, PCI and PCMCIA
- ❑ Up to 4 Drive Bays — Tape, CD-ROM, Removable, etc.
- ❑ Configurable System Power — 100 watts to 350 watts

Unrivaled Performance

Dolch PAC portables are available with a broad range of performance options — meeting or exceeding all the best of desktops.

- ❑ CPU Options — 486 up to Dual Pentium at 150MHz
- ❑ Displays — 16.7 Million Colors or Daylight Readable Mono
- ❑ Active Matrix TFT Screens — Up to 12.1-inches
- ❑ Resolution — 640 x 480, 800 x 600 and 1024 x 768
- ❑ Graphics Performance — In Excess of 115 WinMarks™
- ❑ Drives — EIDE or High-speed PCI SCSI — Up to 9 GB
- ❑ Memory — High Speed Cache and EDO DRAM

If you think file transfer is all we do, you need some time away from the office.

Designed for Microsoft Windows 95

To appreciate how much more LapLink® for Windows® 95 has to offer, all you have to do is hit the road.

Wherever you go–across the hall, across town or across the country–if you've got LapLink, you have everything you need to access anything you want on your desktop *or* your network.

With this single piece of software, you can read and send e-mail, run databases and custom applications, synchronize data and, yes, even transfer files.

Since there's no need to change apps to do all these things, there's no need to hang up and redial. And since LapLink works the same way over modems, IPX and TCP/IP networks, serial cables, parallel cables, wireless, even the Internet, there's no need to laboriously reconfigure.

And there's no need to worry about compatibility. Our 16-bit version is built right into LapLink for Windows 95, so connecting to Windows 3.1 systems is no problem at all.

By now, you probably can't wait to get your hands on the latest LapLink. So you'll be glad to know that upgrading–from an earlier LapLink, or from another product altogether–is ridiculously inexpensive. Call **800-224-7704**. Better yet, see your reseller. It'll give you an excuse to get away from the office.

TRAVELING SOFTWARE

Circle 160 on Inquiry Card (RESELLERS: 161).

Test Specs

We picked the best portable Pentiums by running low-level and application benchmarks under Windows 95, as well as battery tests under real-world conditions. We also weighted important notebook features and how easy a system is to set up and use.

Performance

For the Windows 95 application benchmarks, we ran scripts with 32-bit versions of Microsoft Word (7.0) and Excel (7.0) plus a 16-bit version of FoxPro (2.6). NSTL's low-level InterMark Multimedia PC tests exercise specific components of the notebook: CPU, hard drive, CD-ROM drive, and sound (percentage of CPU utilization). InterMark video benchmarks test how well a system can produce multiple Windows draws, bit-mapped images, and display screens generated by applications like PowerPoint and CorelDraw.

Battery Life

We measured battery life with our Thumper II battery run-down tester. Thumper II emulates a typical word processing session. It uses robotic arms and an optical screen sensor to detect and control each system's power management function. Before testing, we completely drained and recharged each notebook's battery twice, according to the vendors' instructions. People use their notebooks in different ways, so you will probably get different battery life with a given portable.

Features/Usability

We reward features that differentiate the notebooks. For instance, AMS, Compaq, Dell, Digital Equipment, Hewlett-Packard, IBM, Impulse, NEC, and Toshiba back their systems with impressive three-year warranties, as opposed to one-year warranties with the other vendors. We asked the vendors to fill out a lengthy features questionnaire, and we verified the features in the labs. For usability, technicians worked extensively with each notebook to assess the quality of the keyboard, status indicators, and pointing device. We also evaluated the user's manuals and checked how easy it was to install modular components and upgrade the systems with memory.

Evaluations in this report represent the judgment of BYTE editors, based on tests conducted by NSTL, Inc., as documented in a recent issue of its monthly PC Digest. *To purchase a copy of the full report, contact NSTL at 625 Ridge Pike, Conshohocken, PA 19428; (610) 941-9600; fax (610) 941-9950; on the Internet, editors@nstl.com. For a subscription, call (800) 257-9402. BYTE Magazine and NSTL are both operating units of the McGraw-Hill Companies, Inc.*

AMD Inside

Not every road warrior can afford to fork over $3000 or more for a Pentium-powered multimedia notebook. Fortunately, Canon Computer Systems' Innova Book 360CD provides Pentium performance without the Pentium price. It's a full-fledged multimedia notebook with a price of only $2599, but it uses the Pentium-compatible 133-MHz 5x86 processor from AMD.

Innova Book 360CD
$2599

Canon Computer Systems, Inc.
Costa Mesa, CA

(800) 848-4123

http://www.ccsi.canon.com

Circle 1064 on Inquiry Card.

The Innova Book 360CD doesn't compare favorably with Pentium systems when tested with NSTL's InterMark test of low-level functions. In particular, it was dead last in memory performance. However, these factors don't appear to matter with Windows application performance. With our application tests, the Canon portable outshone all other test systems.

What's the price trade-off then, if not performance? For one thing, Canon cut costs on components by using a 10.4-inch dual-scan VGA display instead of an active-matrix screen and a nickel-metal-hydride (NiMH) battery instead of a longer-lasting lithium-ion battery. The battery lasted 2 hours and 18 minutes in our battery run-down tests, while lithium-ion-equipped models averaged 2:48.

The 6.7-pound (with battery) Canon notebook is light for a multimedia notebook, and it has a modular design with a four-speed CD-ROM drive on the right side that you can swap with a floppy drive. The laptop has an IrDA infrared port in the back, and a Type III PC Card slot and an external monitor port on the left side. It has a 32-bit VL-Bus architecture and 1 MB of video memory to boost its graphics performance.

The unit is ready to hit the road right out of the box with applications such as Sidekick for Windows 95 and FaxWorks 3.0. It also has on-line user documents for each of the bundled applications, so you don't have to drag manuals with you on business trips. Canon backs the Innova Book 360CD with a one-year warranty for parts and labor. **–Eds.**

Running on NT

Is Microsoft's Windows NT 4.0 the answer to our OS prayers or just a set of incremental improvements?

By Robert L. Hummel

Without any fanfare, Microsoft has released the long-awaited upgrade to its high-end workstation and server OS products: Windows NT 4.0 Workstation and Server. In contrast to the pop-rock launch for the consumer-oriented Windows 95, Microsoft is aiming NT 4.0 squarely at business users. And with an impressive list of features and performance improvements, NT appears to hit its target.

NT 4.0 seems to promise something for everyone. For Windows 3.x users who want more reason to upgrade than just the pretty face of Win 95, NT 4.0 adds an alluring combination of stability and security. Users get a performance boost, a wide range of new and better features, and enhanced Internet connectivity.

The sweeping changes made to NT 4.0 touch nearly every service and aspect of the OS. It's easy to see signs of upgrades in the interface, management tools, Internet and networking capabilities, programming interfaces, and performance.

Performance

We've had beta versions of the new NT in the BYTE lab for a while. However, it wasn't until Microsoft handed us the final release code—barely in time to make this issue—and we did some real-world testing with the actual OS that we could determine how well NT's performance matches its promotion.

The features table and performance charts on pages 128 and 129 summarize our findings. Except where noted, performance results are for NT 4.0 Workstation. We focused more heavily on Workstation because, to users of Windows 3.x, the target audience for the upgrade, it's unfamiliar. In contrast, those users interested in NT Server are likely already familiar with NT's capabilities from their experience with version 3.51.

We configured three mainstream systems for testing: a Gateway Pentium-133 with 64 MB of RAM, a Gateway Pentium Pro-150 with 64 MB, and a Cyrix 6x86-P200 with 32 MB. The hard disks in the Gateway systems were connected to the system boards' IDE interface. The Cyrix system used an Adaptec AHA-2940 SCSI adapter and a SCSI hard drive.

Each system was equipped with a PCI-based Matrox Millennium video adapter configured for 1024- by 768-pixel resolution with 256 colors. Matrox supplied video drivers for Win 95 and NT 3.51, and we used the Microsoft video driver that comes with NT 4.0.

BYTE'S TAKE

WINDOWS NT 4.0

A new (Windows 95) interface, Internet support, and distributed object technology make NT 4.0 worth buying, despite the installation hassles caused by its numerous hardware and software incompatibilities.

To evaluate performance, we used the new SYSmark/32 1.0 benchmark for Win 95 and NT platforms. This test measures performance in six categories by executing scripts that run eight real-world applications: Adobe PageMaker 6.0, CorelDraw 6.0, Lotus Freelance 96, Lotus WordPro 96, Microsoft Excel 7.0, PowerPoint 7.0, Word 7.0, and Paradox 7.0.

The results of this first round of tests (see the benchmark charts on page 128) show a clear trend: NT Workstation 4.0 outperforms both NT 3.51 and Win 95. On the Cyrix system, however, we discovered that a change made to the NT code just before final release produced some surprising results (see the text box "NT 4.0 Bogs Down on Cyrix 6x86" on page 128 for more information).

On the Pentium system, NT 4.0 bested Win 95 in all categories, delivering an average 12 percent performance increase. NT 4.0 showed a stunning improvement of 49 percent in the graphics test and 33 percent in desktop publishing. Microsoft's decision to move the display and print drivers into the kernel (see the Tech Focus on page 130) and its attention to optimization have clearly paid off.

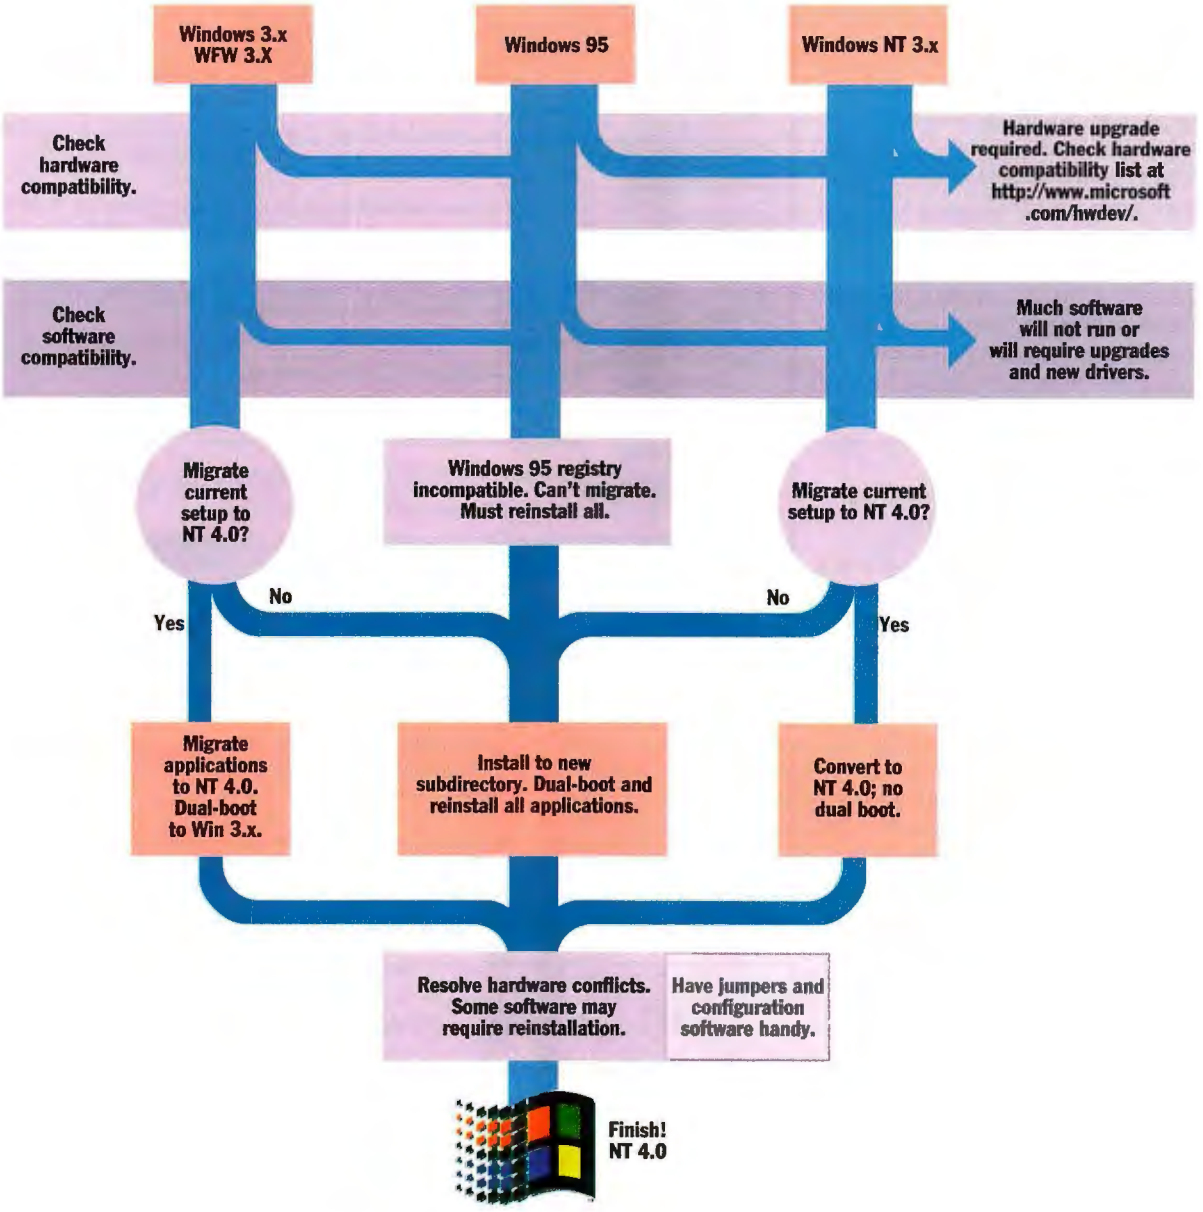
The improvement over NT 3.51 averaged 30 percent. We attribute this seemingly high score to a 45 percent increase in word processing scores and a 40 percent increase in spreadsheet scores, results that are due to the poor performance of 3.51, which fell below that of Win 95 in those categories.

The performance differential between NT 4.0 and Win 95 is much more dramatic on the Pentium Pro system. The Pentium Pro's CPU core is optimized for 32-bit operation at the expense of 16-bit instructions, so it naturally favors NT over Win 95, which is still built around 16-bit DOS code. Improvements in the graphics architecture also contributed to the 68 percent increase in the graphics benchmark.

Again, NT 3.51's lackluster word processing and spreadsheet performance are obvious, allowing Win 95 to turn in better scores, even on the Pentium Pro. In the same tests, NT 4.0 shows increases of 40 percent and 29 percent, respectively. Increases in the other graphics-based tests range from 12 percent to 22 percent.

Windows NT Server 4.0 is also faster than NT 3.51 Server. We compared old

Upgrade: The Roads to 4.0



Upgrading to NT 4.0 from other versions of Windows can be a low-cost, easy job or an expensive nightmare requiring you to replace much of your hardware and software.

and new Server versions of NT using a SQL server benchmark developed by NSTL (see "Powerhouse Pentium Pro Servers," September BYTE, for test details). Running Microsoft SQL Server 6.5 under both versions of NT Server on a four-processor, 200-MHz ALR Revolution Quad6, we noted a 5 percent overall performance increase under NT 4.0 Server when testing with up to 16 users. The test is CPU- and memory-intensive and doesn't measure I/O performance.

Interface and Management

Surely the most prominent change to NT 4.0 is the addition of the Win 95 user interface. Present are the familiar Start button, Taskbar, Shortcuts, Network Neighborhood, and My Computer. Also included is Windows NT Explorer, which provides a hierarchical view of each drive and folder, including network drives.

Desktop management should get easier for system administrators as well. NT's User Profiles and System Policies provide a convenient means to control access to network and desktop resources. System policies help administrators to standardize desktop configurations and enforce behavior. And you can store roaming us-

ers' profiles on an NT server so that users always receive the same desktop, regardless of their location.

Internet Operability

If Internet immersion is the name of the game, then Microsoft is playing for keeps. NT 4.0 includes Internet Explorer (IE) 2.0, Microsoft's Web browser. (Unfortunately, Microsoft released a much-improved version, IE 3.0, shortly after NT 4.0 shipped—too late to make it onto the NT 4.0 CD-ROM.) IE supports existing Hypertext Markup Language (HTML) standards, such as tables, while also incorporating extensions for in-line sound and video, background Secure Sockets Layer (SSL) support, and support for Internet shopping applications.

On NT Server, Internet Information Server (IIS) has been upgraded to version 2.0. Features include easier setup, administration from a Web browser, and support for Systems Management Server (SMS) as well as SNMP administration tools. Microsoft claims that IIS 2.0 is 40 percent faster than the previous version.

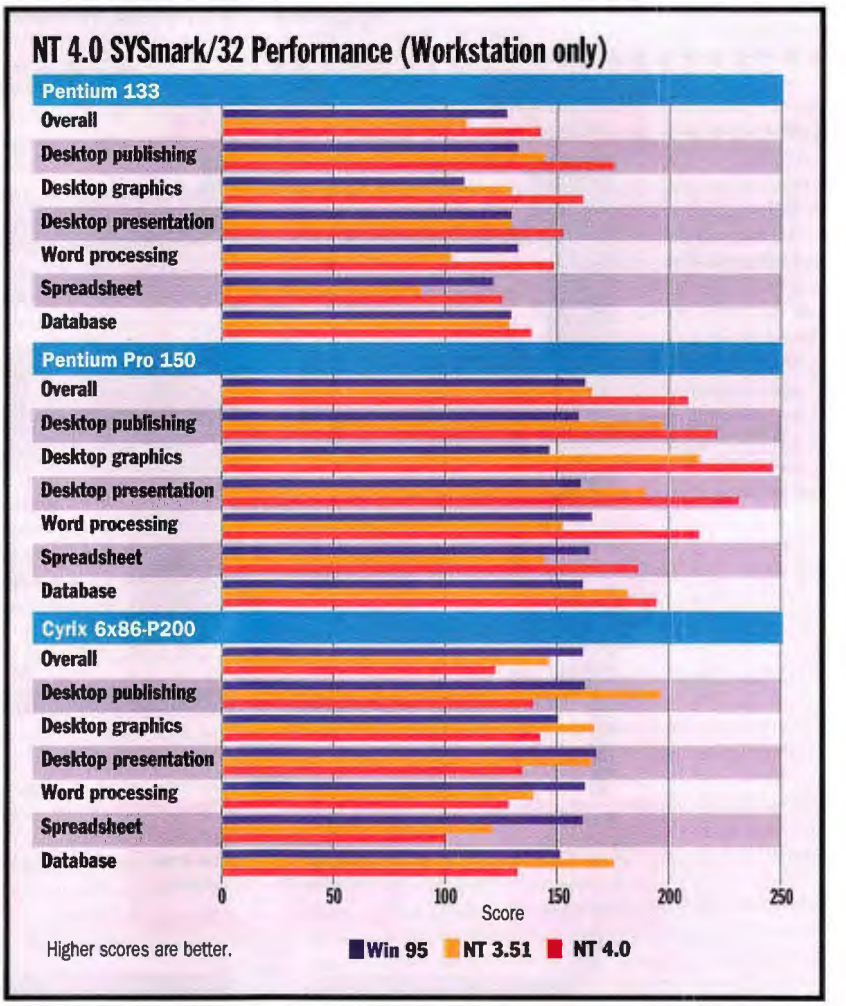
Peer Web Services (PWS), a subset of IIS Workstation, enables any user to publish personal Web pages over a corporate intranet. PWS also offers a platform on which to develop and test Web applications. While much more modest than IIS in resource requirements, PWS provides all ISAPI extensions and filters and is integrated into the NT security model.

Networking Enhancements

NT Workstation now has an improved version of Client Services for NetWare that supports NetWare Directory Service (NDS). This enables NT users to log in to NetWare 4.x servers running NDS and access files and print resources. It's integrated into NT and offers NDS authentication, browsing and print capability, and full support for NetWare log-in scripts, property pages, and NDS passwords.

The Point-to-Point Tunneling Protocol (PPTP) is an open standard that allows you to use the Internet, or other public carriers, to provide secure connectivity between remote clients and public networks. It also provides the basis for Microsoft's Virtual Private Network (VPN) technology.

Using PPTP, remote users can dial into a local Internet provider and tunnel into their corporate network, seeing the same security and features found on their pri-



NT 4.0 Bogs Down on Cyrix 6x86

In testing the final-release candidate of NT Workstation 4.0, BYTE discovered a performance discrepancy when running the software on a Cyrix 6x86-based PC. While running the BAPCo SYSmark/32 suite of 32-bit Windows applications, we noticed a slowdown of 31 percent in the final version of NT 4.0 that was released to manufacturing, compared to the previous release candidate. In both cases, BYTE tested NT on the same PC, which uses the Cyrix 6x86-P200+ running at 150 MHz (see the charts above).

Intel-based PCs running the same NT beta software did not exhibit such a performance decrease from one NT beta to the next. Additionally, NT 4.0 running on the same Pentium system ran the SYSmark/32 applications suite an average of 30 percent faster than NT 3.51, and 12 percent faster than Windows 95. Pentium Pros ran NT 4.0 26 percent faster than NT 3.51, and 28 percent faster than Win 95. The Cyrix 6x86, on the other hand, ran NT 4.0 16 percent slower than NT 3.51, and 24 percent slower than Win 95.

Microsoft added code to NT to change the way it runs on Cyrix-based PCs. Phil Holden, a product manager in Microsoft's Desktop & Business Systems Division, confirmed these changes were made to make NT more stable on the Cyrix platform. This may be the source of the application's performance slowdown. BYTE will have a full report next month. **–Dave Andrews**

vate network. From the user's perspective, the physical connection path is irrelevant; the VPN tunnel encapsulates all data in IP packets. VPN supports all the major network protocols, including TCP/IP, IPX/SPX, and NetBEUI.

The updated version of Dial-Up Networking now provides *channel aggregation*, the ability to combine the bandwidth of all available dial-up lines to achieve higher transfer speeds. For example, you can combine two PPP-compliant ISDN B channels or two standard modem lines to double the effective bandwidth. You can also mix ISDN lines with standard analog modem lines.

Two NT server services, Windows Internet Name Service (WINS) and Domain Name System (DNS), have been combined to provide a form of dynamic DNS. Users can enter fully qualified DNS domain names, making it easier to connect to system resources.

NT now supports the Windows Messaging Client, a universal e-mail inbox that includes drivers for Internet and Microsoft mail. Internet support includes the ability to exchange mail over any network with SMTP or Post Office Protocol 3 (POP3) services. Messaging Client includes full MAPI 1.0 support, allowing you to send, receive, organize, and store e-mail and file-system objects.

Network OLE, which is now dubbed Distributed Component Object Model (DCOM), is a step closer to reality in this release. DCOM, a system of software objects designed to be reusable and replaceable, in theory allows you to distribute processes across multiple computers by providing the object-based communications infrastructure. NT 4.0 supports DCOM by hiding the details of application pointers from both the application and the object.

New APIs

NT 4.0 now supports several new or updated APIs. For example, a set of encryption APIs lets developers create applications that work securely over nonsecure networks, such as the Internet.

For instance, Telephony API (TAPI) provides a platform for developing end-user computer telephony and communications applications. TAPI abstracts a wide array of telephone hardware and services, providing a standard programming interface. TAPI hides the actual details of a phone connection from an application in the same way that a network relieves an application from knowing the physical location of a printer.

NT 4.0 now supports the multimedia APIs introduced in Win 95. DirectDraw provides a device-independent way to access display-dependent features, such as memory, bit block transfer, and color decompression. It also enables digital video playback by taking advantage of the various types of hardware support available on video adapters, such as video stretching.

DirectInput offers joystick support and control. The DirectPlay API provides simplified access to communications protocols and on-line services for games. The DirectSound API provides direct control of audio hardware and is designed to enable 3-D audio support in games. Under NT 4.0, however, DirectSound is emulated, and calls get translated to existing Win32 API calls at run time.

Support for these multimedia APIs will enable developers to create games and other applications for NT that were previously limited to Win 95. In addition, the Compact Disk File System (CDFS) has been upgraded to support Auto-Run and CD-XA, the format for video CDs that contain MPEG movies.

Shortcomings

The Plug and Play (PnP) philosophy states that your computer, add-in hardware, and software should work together without user intervention to configure themselves and resolve any conflicts. It's a noble goal, but it's one that NT doesn't yet reach in this release.

As partial compensation, NT supports hardware profiles, allowing users to select from a list of known configurations (e.g., docked and undocked configurations for a notebook computer). Profile variables might include video resolution, network cards, and client services.

Other aspects of PnP can cause problems when you're installing NT 4.0. Interrupt-request (IRQ) and I/O-address conflicts between hardware components that Win 95 resolved, for instance, often stopped our NT installation in its tracks. Whether or not you're using PnP periph-

PERFORMANCE	★ ★ ★ ★

erals, make sure that you know the I/O-address and IRQ requirements for your hardware and have your jumper settings or configuration software and driver disks handy before you begin installation.

Caching disk controllers can also be a problem under NT because a reboot or a power failure could occur before the cache is flushed. Support for caching is limited to the DPT or IBM SCSI adapters for which drivers exist. However, you can use other controllers in write-through mode or with caching disabled.

It's reasonable to expect that some older, obsolete hardware won't be supported in a new OS release. However, NT 4.0 lacks support for wave-table sound on current Sound Blaster PnP sound cards. Support for the ATAPI CD-ROM interfaces on these cards is also nonexistent. Before you plunge into an upgrade, be sure to check out the latest hardware compatibility list at Microsoft's Web site (http://www.microsoft.com/hwdev).

In general, applications that attempt to access hardware directly won't work. This includes software to control sound cards, video cards, scanners, and so on. In addition, NT doesn't support virtual device drivers (VxDs), so a lot of multimedia applications, games, and memory management utilities won't work. Other applications may fail due to poor programming practices; for instance, they may refuse to install under NT instead of checking whether the required services are available.

Users of Win 95 might be disappointed that there is no automatic upgrade path to NT 4.0. Microsoft attributes this to differences in registry architectures between the two products and assigns partial blame to applications that store files in different places on the two systems. Installing NT 4.0 on a Win 95 system requires that you install to a new directory and then reinstall all your applications. For advice on the issues and procedures involved, check Microsoft's upgrade paper at http://www.microsoft.com/ntworkstation/95ontw.htm. For an overview of the upgrade process, along with the possible paths and pitfalls, see the figure "Upgrade: The Roads to NT 4.0" on page 127.

Windows' perennial lack of driver support continues to plague this release of NT (by comparison, Win 95 supports approximately 1000 more drivers than NT does). Categories in which NT falls short include video, audio, and PC Card subsystems. The Win32 Driver Model (WDM) is being advanced to address this problem by providing a common set of I/O services and binary-compatible device drivers for future versions of NT and 95.

Finally, if you have been running NT on a 386-based system, Microsoft has a message for you: It's time for you to stop. Performance considerations aside, NT 4.0 is now coded to require a 486 or higher processor to run on x86-based systems.

Within the limits of the NT architecture, Microsoft has done a good job of supporting hardware peripherals. NT 4.0 recognizes and configures itself automatically for a greater variety of hardware during installation than version 3.51 does. And Microsoft has provided new NT 4.0–style drivers for a wide range of printers and video systems.

There's no doubt that NT 4.0 has a slick interface, powerful features, and raw performance. The more important question is whether it will work with your hardware and software. You'll have to answer those questions yourself, mainly through trial and error. But all in all, NT 4.0's better performance and greater feature set are adequate compensation for any upgrade troubles. TECH FOCUS ARCHITECTURE

Getting to the Kernel: Is NT Still Safe?

To improve NT 4.0's performance, Microsoft moved some of the OS's most critical processes closer to the unprotected code of the microprocessor. Now NT's Graphical Device Interface (GDI)—which handles all writing to the screen—is in the NT Executive; this gives it Ring 0 status and potential access to important system-data structures. Ring 0 is one of the Intel processors' four protection modes, in which OSes typically run trusted or performance-sensitive kernel-level processes, such as file management and keyboard input.

This move raised concern that NT would be less stable and more likely to crash. We seriously considered trying to prove or disprove the point by trying to "break" NT 4.0 with older video cards and drivers. But we quickly realized that such tests would take a lot of work to prove what we already know from analysis: NT 4.0's stability will not be substantially affected by the Ring 0 change.

The real issue is—and always has been—unruly or buggy device drivers. Essentially, they have always been part of the OS and have had low-level control of the CPU. Bad ones will crash NT 4.0, just as they've brought all its predecessors to their knees. Microsoft is trying to steer people away from risky behavior by telling them to use only hardware that's on a Microsoft-approved list. A product's placement on the list means that Microsoft has written and debugged its device driver.

Admittedly, this smacks of a smug solution that serves to place the onus on users while requiring them, in some cases, to buy new hardware when they upgrade to NT 4.0. But again, the same was true with previous versions of NT. We think most corporate buyers of NT are not likely to stumble blindly into hardware conflicts, especially with their mission-critical servers.

It's true that when NT's GDI wasn't in the kernel's memory space, a crash theoretically was more likely to freeze only the screen, leaving background processes intact. We haven't heard of this ever happening, however. Besides, rebooting would be inevitable, since at some point the user would need access to screen output.

Finally, some nervousness about the GDI move to the NT kernel derives from a misunderstanding about what Ring 0 status means. It does not mean that a process has carte blanche to write anywhere in memory that it pleases. Rules exist, but poorly written or malicious drivers have always been able to ignore them. –Eds.

Let Microway build your next Graphics Workstation, Web Server or Personal Supercomputer using

The fastest motherboard on the planet...

500 MHz, 1 Gigaflop

It's a Screamer™

The Microway family of "Screamer" motherboards utilizes the fastest processor to hit the workstation market in the last ten years! The DEC Alpha 21164 not only blows away all other CPUs, but has the VLSI support needed to build memory systems that take full advantage of its numeric speed. Microway Alpha based products set a new standard in price/performance for workstations. The 433/500 MHz Alpha is a clear winner in both the numerics and integer processing arenas. With its ability to issue four pipelined instructions per cycle, the 21164 hits peak speeds of 2000 MOPS. Common numeric operations, such as dot products, peak at a mind-boggling, on-chip throughput of 1 gigaflop! This results in Linpack ratings that go from 150 to 600+ mflops (as vector lengths increase) and scalar rates of 160 to 300 mflops. Systems priced from $5995 for 300 MHz.

Memory, Cache, PCI . . .

The biggest challenge to running numeric intensive code on CPUs clocked over 200 MHz is building a cache/memory subsystem capable of keeping up with the CPU's numeric units. The 21164's Harvard architecture starts with two 32 deep 64-bit register files, followed by two 8K primary caches and and internal 96K cache. The 21164's external 128-bit data bus gets fed by 2 to 8 MB of Bcache built with 9ns SRAMS. The 256-bit wide interleaved memory subsystem that backs up the Bcache can hold up to 512 MB of DRAM. The coupe de grace is the Screamer's PCI bus interface, which can accommodate both 32- and 64-bit PCI add-in cards. The Screamer is the biggest numeric winner Microway has introduced since we made it possible to run an 8087 in the IBM-PC in 1982!

A motherboard by itself does not a system make.

Microway adds the operating systems and compilers you need to put the 21164 to work. These include NT, Linux, DEC UNIX and OpenVMS, which now run thousands of applications including AutoCad, Excel and Word. The Screamer and Microway's NDP Fortran, C | C++ and Pascal compilers are available to both OEMs and end users.

DEC, Alpha, OpenVMS and DEC UNIX TM Digital.
NT, Excel and Word TM Microsoft. AutoCad TM Auto Desk.
Screamer, NDP Fortran and Microway TM Microway.

And more . . .

Microway also designs DSP cards based on the i860, personal SuperComputers that run up to 24 i860's, Alpha add-in cards and 32-bit globally optimized, RISC-scheduled compilers for the Alpha, Pentium and i860; running on DOS, OS/2, UNIX, Linux, NT, DEC UNIX and OpenVMS. Whether you are an end user or an OEM, our technical staff will gladly configure the correct solution. Since 1982, Microway has earned a solid reputation for designing state-of-the-art products and following up with excellent technical support.

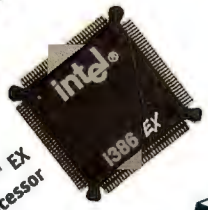
radical technology embedded



New 33MHz Intel386™ EX embedded processor

QNX RTOS with Photon microGUI™

QNX The Leading Realtime OS for PCs

New RadiSys R380EX system controller

The New EXPLR2:

All the hottest embedded technologies on one handy eval board!

Combine the latest products from the leaders in embedded PC technology and what do you get? Faster time-to-market. More functionality with less hardware. A longer production life for your product. And a lot less work.

Intel's EXPLR2 makes your design work easy. All the hardware you need is fully integrated, so you can start prototyping right away. Better yet, the design-capture files come included. Just cut and paste to create your custom system.

The EXPLR2 also comes with QNX, the realtime OS that delivers high-end performance, even on low-cost hardware. Exceptionally small and fully scalable, QNX gives you a POSIX-certified environment *and* a full-featured GUI in under 1MB of memory!

The EXPLR2 comes with something else. Commitment. With their long-term commitment to embedded applications, Intel, RadiSys, and QNX Software Systems are the right companies to give your designs a real future. **Radical!**

Web Surveys

Helpful techniques for Web-based data collection and analysis.

The BYTE Site is, among other things, a giant survey application. Each of its 6000+ archive pages presents a link to a feedback form. Or rather, as I explained last October (http://www.byte.com/art/9510/sec9/art1.htm), to a script that generates a form that's customized for each article. Recently, I began harvesting this data to answer questions like "How highly do site visitors rate State of the Art articles?" and "How often do site visitors say they read BYTE magazine?" We've also run Web surveys to ask visitors about their experiences with ISDN, assessment of uninterruptible power supplies (UPSes), and OS preferences.

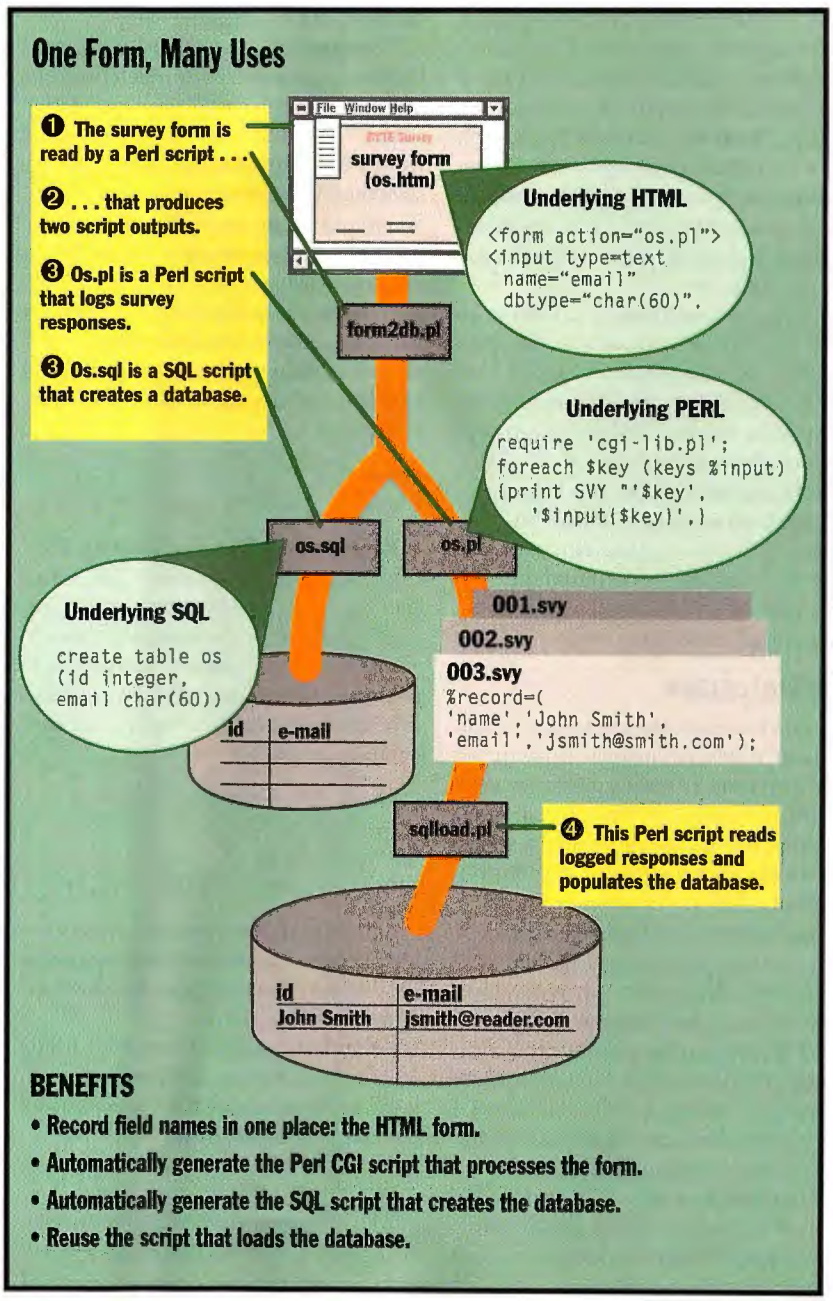
Along the way, I've refined the techniques and tools I use to capture, store, and analyze survey data. I hope you'll find them useful for surveys and other kinds of Web-based data collection and analysis.

The Form

I tend to bail out when confronted by a sprawling multipart Web form, and I assume you do, too. So I try to make my own forms as concise as possible—ideally, just a single screen. The most effective space-saving device is the Hypertext Markup Language (HTML) `<select>` tag. The drop-down lists that it creates ask multiple-choice questions far more compactly than arrays of radio buttons or checkboxes can. Forms built with drop-down lists render more quickly. Browsers tend to struggle when given too many discrete form elements.

While I prefer the drop-down list, two circumstances militate against its use: multiple selection and no sensible default.

http://www.byte.com/
Web Project Conference



PHOTOGRAPH: KELLIE WALSH © 1996

The <select> tag does, of course, support multiple selection. You simply add the attribute multiple="yes." However, a multiselect drop-down list looks the same as a single-select one. No visual cues tell you that multiple selection is available or that Ctrl-click is the way to operate it. Explaining these things chews up screen space. If the number of choices is not too large, you may be better off with a self-explanatory set of checkboxes.

Without a sensible default choice, there's a similar trade-off between a drop-down list and checkboxes. A drop-down list always returns a value; a checkbox set may not. To differentiate a passive "no reply" choice from a drop-down list's active choices, you have to encode it explicitly as the default choice. You can use that item to document the drop-down list (e.g., "multiselect from below"). Still, I'm never quite comfortable with the semantic inconsistency of this approach. Again, you need to weigh the compactness of the drop-down list against the elegance of a checkbox set.

To lay out your forms, you can use an HTML editor, or you can just clone an existing form and tweak it with a text editor. I do the latter; HTML widgets are really quite simple. To simplify layout, I enclose elements between a <pre>... </pre> tag pair that specifies monospacing and hard newlines. Within this preformatted region, you can still use (bold), (italic), or even Netscape <font size> tags to clarify the organization of the form.

The Database

For surveys and other data-collection applications, there's no reason to wire the form directly to a database unless you need the information available in real time. Dumping records into structured text files is a simple, low-overhead, and highly effective solution. For example, the BYTE on-line archive logs feedback as a set of files, each containing a single ASCII-delimited record. The concatenation of this set of files forms a database import file.

When I began harvesting this data, though, I ran into a few limitations. The import records weren't self-descriptive—that is, they didn't carry field names along with values. Lacking names, an import tool must rely on an ordering of fields defined elsewhere. Many import tools allow a special first row of field names. But including such a row in each record wouldn't solve another problem—poor handling of multiline text data.

The surveys I run usually ask both quantitative questions ("How much did your ISDN installation cost?") and qualitative ones ("What was your ISDN experience like?"). No one tool is best suited to analysis of these two very different types of data. You want a relational database or statistics package for the quantitative data and a text database (possibly a searchable HTML archive) for the qualitative data. How can you store information destined for either or both of these repositories? I've settled on a text representation of a Perl associative array:

```
%record =
('name1',"val1",'name2',"val2");
```

If you process the form data with a Perl Common Gateway Interface (CGI) script that uses cgi-lib (http://www.bio.cam.ac.uk/cgi-lib/) or an equivalent library, you're given an in-memory structure of this type. Unfortunately, Perl lacks a primitive function to ASCII-ize such structures, but it's not difficult:

```
foreach $f (keys %record) {
 s/\"/\\"/g;
 print RECORD
"'".$f."\',\"".$in{$f}."\",\n";}
```

As long as you take care to convert double-quote to backslash-double-quote, as shown here, this technique handles multiline text fields nicely.

If the file handle RECORD maps to the file 0001.REC, a subsequent Perl script can parse and reconstitute the %record array with the single statement

```
do '0001.REC';
```

What's the point of all this? It's now trivial to write Perl scripts that transform collections of such files into a variety of database import formats or directly to an HTML textbase. For relational analysis, sqlload.pl (http://www.byte.com/art/download/sqlload.pl) produces a SQL load file containing a bunch of INSERT INTO statements. For textual analysis, I use variants of another script that builds a simple, navigable Web archive.

The Tool

Tools that marry Web forms to databases tend to assume, reasonably enough, that you're acquiring data directly into a database. They typically use templatized HTML forms containing triggers that read or write database fields. For a survey, however, it's convenient to separate data collection from database import—particularly when you're building both relational and textual databases from a common data set. Thus, there's no reason to use a template-oriented tool such as Cold Fusion or the Microsoft Internet Information Server (IIS) Internet Database Connector (IDC).

What's more, I've found that these products don't simplify database bookkeeping to the degree I'd like. They assume that you'll build both an HTML template and a corresponding database schema. You end up with two sets of field names that you have to maintain in sync. It's not a big deal, but life's short and I'm lazy, so I wrote form2db.pl (http://www.byte.com/art/download/form2db.pl) to generate a database schema automatically from an HTML form. This Perl script relies on the fact that browsers will quite happily ignore user-defined HTML attributes. For example, browsers render the input text box described by the following code:

```
<input type="text" name="email"
dbtype="char (50)">
```

which is the same as

```
<input type="text" name="email">
```

The dbtype attribute, which I simply

EMBRACE THE INTERNET WITH LOTUS NOTES

As the Internet expands and creates new business opportunities, Lotus technologies provide the platform for the integration of the Internet and Intranet into your daily business.

Notes and the Net

We've brought the power of Lotus Notes® to the Internet/Intranet. Only Notes™ Release 4 offers replication, authentication, directory, messaging and security services in a single package – a full set of proven facilities for developing functionally rich business applications, operating across platforms. And now, Notes is the software solution for developing interactive and secure Internet business applications.

Introducing Domino

Domino is code name for the new server technology which transforms Lotus Notes into an interactive Web applications server, allowing any web client to participate in Notes applications securely. Domino bridges the open networking environment of Internet standards and protocols with the powerful application development facilities of Notes. The new Notes server provides businesses and organizations with the ability to rapidly develop a broad range of business applications for the Internet and Intranet.

...and More

Lotus' InterNotes™ Web Navigator delivers 'Team Surfing'. Much more than just a browsing tool, it's Internet access integrated into the core Notes environment. Features like Web Tours and Recommended Pages allow users to share Internet experiences and resources, thus sharing valuable knowledge and adding to team collaboration.

Other Notes Internet products and services include InterNotes News for managing USENET access, Notes Network Information Center for direct Notes-to-Notes communication, Lotus Notes:Newsstand™ for subscription-based publications over the Internet, and more.

www.lotus.com

For more information on how you can embrace the Internet with Lotus Notes, and to get your copy of Domino, explore Lotus on the Word Wide Web at www.lotus.com or call 1-800-828-7086, ext. C177*.

Using the Perl 5 ODBC Module

```
use NT::ODBC; $o = new NT::ODBC("DSN=os");

@use_cli = ('use_cli_mac','use_cli_os2','use_cli_w95',
'use_cli_nt','use_cli_unix','use_cli_w3x');
foreach $s (@use_cli,@use_srv) {
 if ($o->sql("select $s, count(*) from $view group by $s") !=
0)
    { die; };
 print "\n"; &printData;} }

sub printData {
 local ($data);
 while ($o->fetchrow) {foreach $f ($o->field names) {
  $data = $o->data($f); print $data . "\t"; } print "\n"; } }
```

invented, means nothing to browsers. However, when I write forms using this attribute, they can double as database schemata. Form2db.pl parses these enhance forms and emits a SQL CREATE statement. Do you have to abandon your HTML editor if you go this route? Not if it's a smart one that knows how to preserve user-defined HTML. Adobe, for example, says PageMill 2.0 will do this.

There's still more mileage to be gotten out of form2db.pl. I've said that I store each record initially as an ASCII-ized Perl associative array. That implies a CGI script, wired to the form, that writes the ASCII file. It's a simple CGI script—so simple, in fact, that form2db.pl can create it automatically. When I wrote the form for our OS survey, for example, I pretended that the script os.pl already existed:

```
<form action="os.pl">
```

When form2db.pl reads this form, it makes the imaginary script real. The single occurrence of the name os in the form tag drives several related processes. It becomes the name of the table created by form2db.pl's SQL CREATE output, the name of the file containing that output, and the name of the subdirectory in which os.pl deposits records. The figure "One Form, Many Uses" on page 133 summarizes these interactions.

The Analysis

In July's ToolWatch, I mentioned iodbc (ftp://ftp.digex.net/pub/access/psii/iodbc.zip), a command-line interface to the Open Database Connectivity (ODBC) subsystem on Windows 95 and NT. It's the thinnest-imaginable ODBC wrapper, and therein lies its strength. To load the OS survey data into a database, I used ODBC Administrator to create a new data source called OS. (The driver was MS Jet 3.0 and the format was .mdb, but I could have used any database supported by ODBC.) I then issued one command to execute the SQL CREATE code written by form2db.pl:

```
iodbc -S OS < os.sql
```

and another to execute the SQL INSERT INTO code written by sqlload.pl:

```
iodbc -S OS < os.lod
```

Then I launched iodbc in interactive mode to begin exploring the data set:

```
iodbc -S os
1> select count(*) from os
```

This approach makes me a knuckle-scraping Neanderthal or an avant-garde minimalist, depending on your perspective. I see it the latter way, because I find that operating a full-blown wizard-equipped GUI database can take more time and effort than just typing the small bits of SQL you need. What's more, as you write those SQL statements, you discover patterns—that is, opportunities to parameterize and automate SQL queries.

Perl coupled with iodbc is one way to exploit those opportunities, but it's awkward. Perl has to write SQL statements to a file, invoke iodbc on that file, and then parse iodbc's output. A better solution is odbc.pm, a Perl 5 module that makes ODBC SqlExecute and SqlFetch calls directly available to Perl programs. This has two major advantages: The SQL code doesn't have to take a trip through the file system, and its output comes back neatly chunked by row and column.

These two methods are complementary. I use iodbc when first exploring a data set and odbc.pm to codify the repeatable patterns that emerge from that exploration. Today, all this happens on my NT systems only because, while ODBC itself is available for Unix, iodbc and odbc.pm are not yet available. But the Perl scripts I'm distributing with this article will work fine on Unix, as will the generic SQL code they produce. If you're in need of a lightweight Unix SQL engine to use in conjunction with these, try msql (http://www.bunyip.com/).

The Methodology

What did our OS survey reveal? Nothing of value, I'm afraid. I got so absorbed in the mechanics of Web-based data collection and analysis that I ignored the most fundamental survey precept. BYTE senior editor Tom R. Halfhill puts it succinctly: "You can't let the studied population select itself." Team OS/2, an international band of OS/2 enthusiasts, drove that point home with a vengeance.

Two days into the survey, analysis showed that usage of the Mac OS, OS/2, Unix, and various Windows flavors—on desktops and servers—was comparable to what many other sources have reported. A few days later, Team OS/2 struck, and OS/2's numbers soared. An Alta Vista search of the Usenet uncovered one cause of the surge—a posting to comp.os.os2.advocacy, which contained the uniform resource locator (URL) of the survey page.

We reported the results in last month's Bits section on page 32. However, please don't quote the three pie charts, which show OS/2's dominance, without also quoting the portion of text showing that an OS survey response was 12 times more likely to come from the Internet domains ibm.com and ibm.net than was a typical BYTE Site visit.

We'll continue to run surveys on The BYTE Site. The anecdotal information we've gathered, for example from the ISDN survey, seems valuable as an indicator of trends and opinions. Quantitative data may have some limited value as well, on subjects charged with less religious fervor. However, we won't put much stock in the numbers until we can invite true random samples of participants, probably from a (yet-to-be-developed) site-registration database. For that valuable lesson learned, we have Team OS/2 to thank. B

Reflection Suite for X 5.0

OPERATING INSTRUCTIONS, AS DESIGNED BY NETWORK PROFESSIONALS.

PC-TO-UNIX CONNECTIVITY, AS DESIGNED BY NETWORK PROFESSIONALS.

New **WINDOWS NT** *Version Available!*

If it were up to you, even the most complicated things would be simplified: tricycle assembly, VCR programming, maybe even your UNIX network.

Not that you'd want to manage it with one button. But with Reflection X from WRQ, it's almost that easy. Reflection provides a powerful X11R6 PC X server and complete PC-to-UNIX connectivity that lets end-users handily access mission-critical applications right from the Windows desktop.

It has the highest level of application reliability, an award-winning TCP/IP stack, plus 32-bit architecture for faster performance. And best of all, it's everything you need—PC X server, transport, TCP applications, emulation, even an NFS client and Internet access tools—all from one vendor.

Reflection TCP/IP

To try PC-to-UNIX connectivity designed from your point of view, get yourself in gear and call for a free evaluation copy. Then sit back and watch everything go like clockwork.

REFLECTION® X/REFLECTION SUITE FOR X

- ***ARCHITECTURE:*** 32-BIT WITH WINDOWS ACCELERATED VIDEO ENHANCEMENTS (WAVE); X11R6 COMPLIANCE (XTEST AND MULTI BUFFERING EXTENSION (MBX)), OPTIMIZED FOR WINDOWS 95
- ***INTEGRATION TOOLS:*** DIAL-UP X, CONFIGURABLE PANNING, VIRTUAL SCREEN, BACKING STORE AND SAVE UNDERS, 24-BIT COLOR SUPPORT, REMOTE AND LOCAL WINDOW MANAGEMENT, GUI KEYBOARD MAPPING, AND ENHANCED LOCAL PRINTING

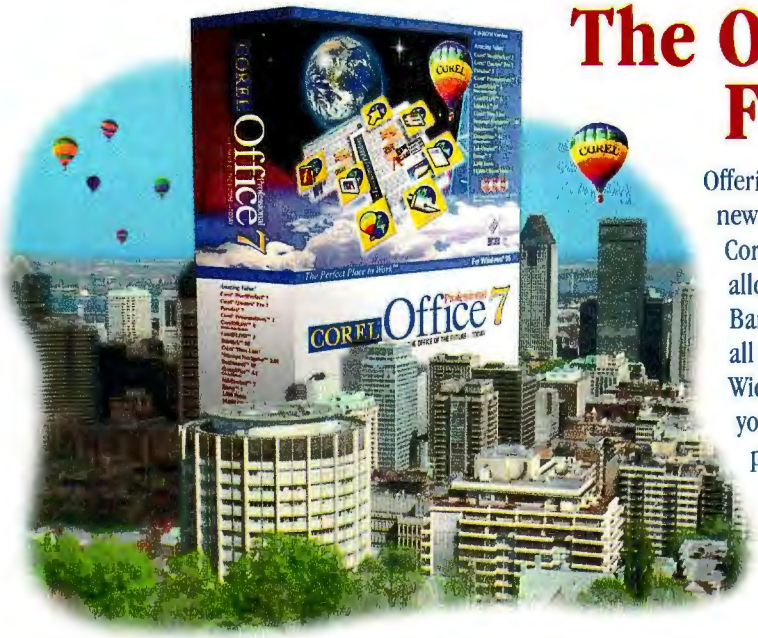
CONNECTIVITY FOR A CHANGING WORLD



The Office of the Future—Today!

Offering the world's most innovative business software and a new dimension in power, functionality and Internet support, Corel® Office Professional 7 is the ***first*** office suite that allows you to publish to the Java™ Language using Corel Barista™ technology. Imagine having the ability to publish all of your existing files, exactly as they appear, to the World Wide Web. Finally, technology that delivers Web pages the way you envisaged them. No more pale imitations. No more programming. No more re-formatting. Just stellar Web documents.

Corel Office Professional 7 gives you all this plus the most robust set of industry-leading business applications available in an office suite. And for added convenience, you'll find that all core applications are compatible with most competitive software. Go beyond traditional document creation. Experience tomorrow's office software—today!

COREL Office Professional 7

Corel® WordPerfect® 7

WordPerfect's extensive cross-platform compatibility is a must for optimum enterprise-wide communications. Corel WordPerfect 7's innovative new features, exclusive tools and superior Internet support continue to make it the word processor of choice for any office.

Corel® Quattro® Pro 7

Analyzing and presenting data has never been more intuitive! With more @functions than the competition, file compatibility with Lotus® 1-2-3® and Microsoft® Excel plus extensive Internet connectivity, Corel Quattro Pro 7 is simply the most comprehensive spreadsheet available.

Paradox® 7

Paradox 7 delivers a winning combination of ease of use, performance and powerful application development—plus ultra-smooth integration with Corel WordPerfect 7 and Corel Quattro Pro 7.

Corel® Presentations™ 7

When you need to inform, educate or persuade, Corel Presentations 7 will put the Internet to work for you—it's an incredibly effective way to convince your audience.

Plus Value-Added Features and Applications!

- CorelDRAW™ 6 illustration module - an incredibly fast and powerful graphics application
- CorelFLOW™ 3 - for high-impact business graphics
- Sidekick™ 95 - an innovative personal organizer
- Corel® Time Line® - the ultimate project management software
- Netscape Navigator™ Internet browser
- Dashboard™ 95 - desktop application launcher
- InfoCentral™ 7 - a powerful database information manager
- GroupWise™ 4.1 client license†
- Corel® A to Z - an extensive electronic reference tool

CDs for the Gigabyte Era

Next-generation optical disks, due this year, offer capacities that are 25 times higher than a CD-ROM's.

By Tom R. Halfhill

DVD is Goliath. Variously defined as digital versatile disc, digital videodisc, or simply a generic trade name, DVD is the next-generation optical disk standard that will bring gigabytes to your desktop. DVDs are the same physical size as today's CDs, but in terms of storage capacity, they're giants: 4.7 to 17 GB per disc, depending on the format. These sizes are up to 25 times the maximum capacity of conventional CDs, whose 682-MB size seemed unimaginably vast only a few years ago.

Like the biblical Goliath, however, DVD has some vulnerabilities. Last summer, unresolved differences over standards and copyright-protection issues were delaying its launch. It was supposed to make a big splash this fall, but don't expect to see significant numbers of drives or discs until next year. That means DVD will compete with the new CD Erasable (CD-E) format, which will also debut in 1997. Many users will prefer a rewritable CD drive to a read-only DVD drive. DVD-RAM is still a few years away.

Still, the insatiable demand of computer users for gigabyte-size storage media will eventually win out. The long-term success of DVD-ROM, DVD Recordable (DVD-R), and DVD-RAM seems virtually guaranteed.

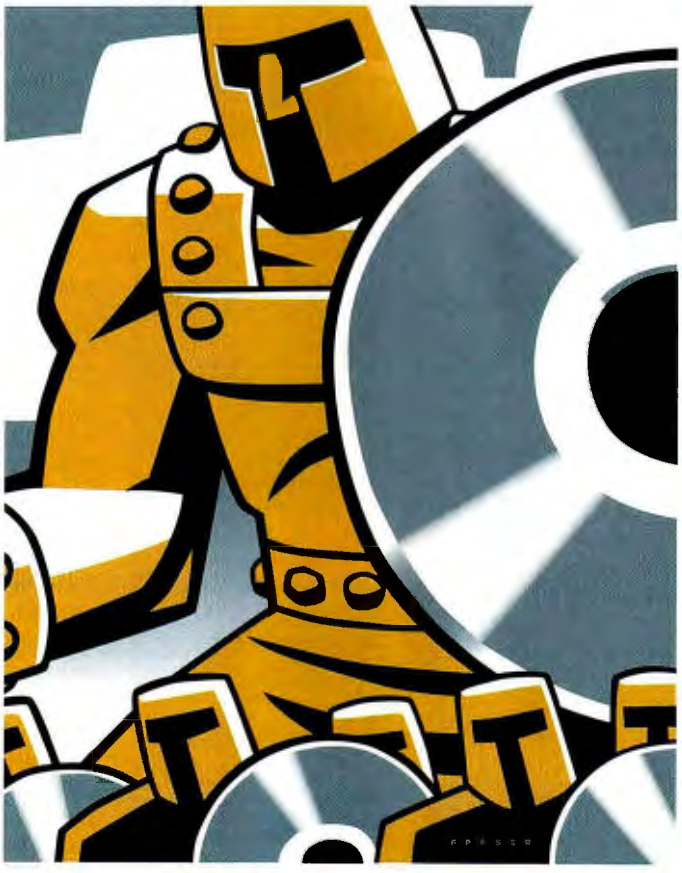

ILLUSTRATION: DOUGLAS FRASER © 1996

Never Enough

The extra space won't go to waste. Multimedia software eats megabytes for breakfast, and growing numbers of companies are distributing documents, databases, and software on CD-ROMs. A higher-density disc will let them consolidate multivolume sets of CD-ROMs on a single DVD-ROM. Moreover, DVD is fast: The first DVD-ROM drives (which should sell for about $500–$600) will be roughly equivalent to a 9× CD-ROM drive, and DVD's greater capacity reduces the need to swap discs.

For example, the popular PhoneDisc PowerFinder USA from Digital Directory Assistance requires six CD-ROMs to store 112 million phone listings. Even with a CD-ROM changer, disc-swapping is slow. In June, the company demonstrated its new DVD version. The entire 3.7-GB database, with the same number of listings, fits on a single DVD-ROM, with room to spare.

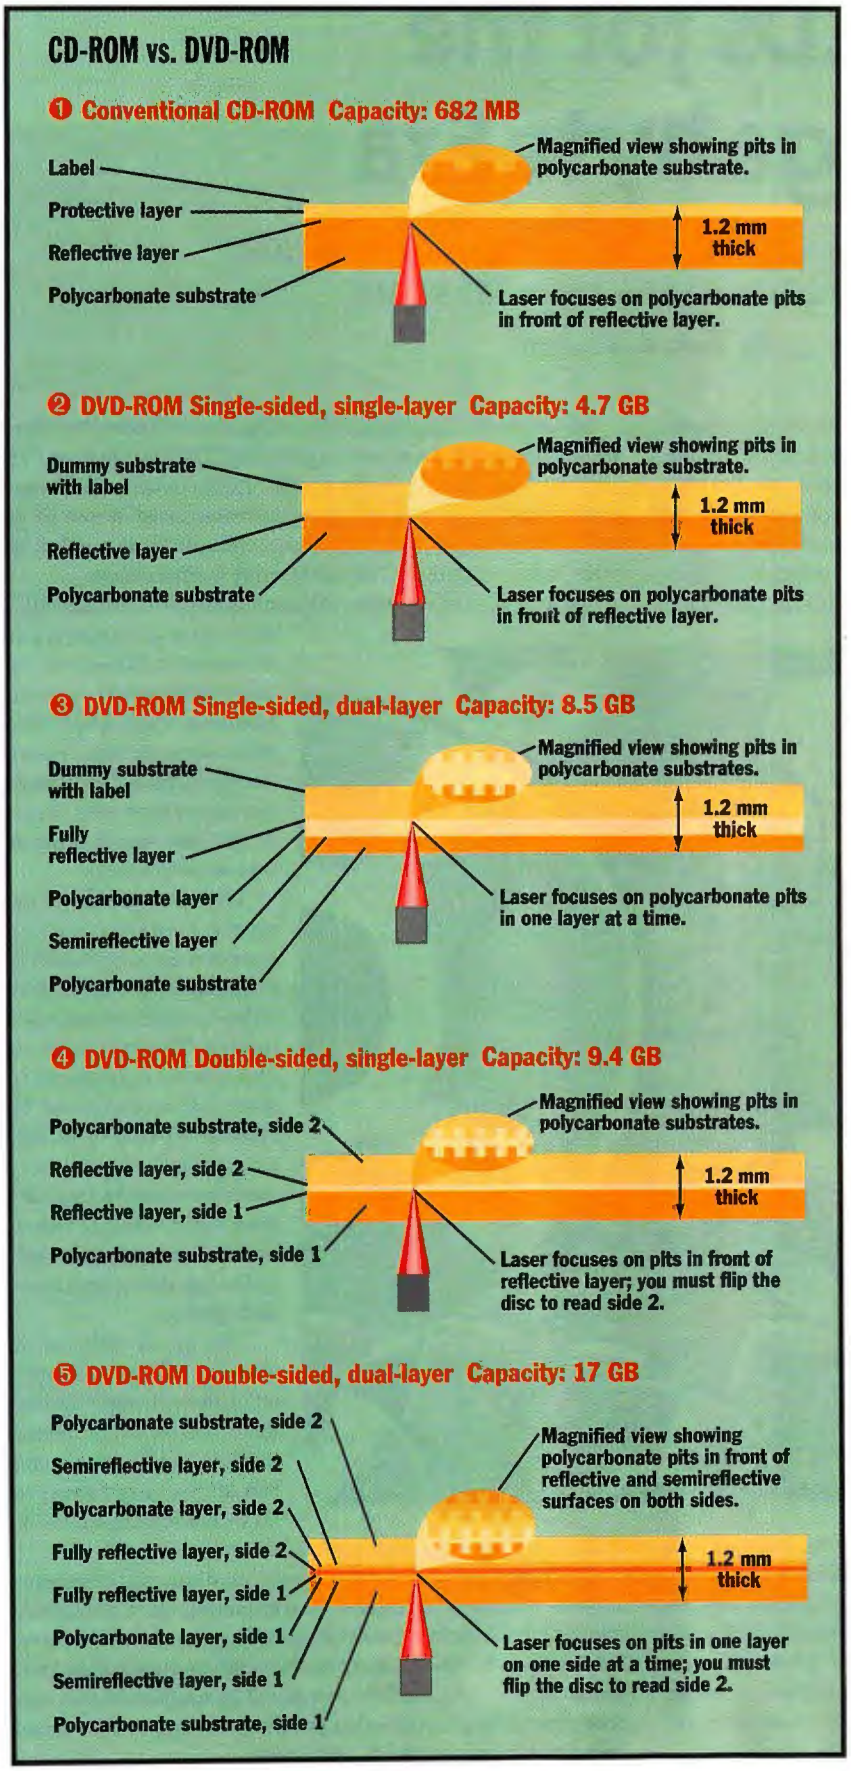
Entertainment software will get a boost, too. Multimedia developers are running out of space on CD-ROMs for their increasingly realistic graphics, video clips, and stereo soundtracks. Games such as Sierra's Phantasmagoria—which fills seven CD-ROMs—could easily fit on one DVD-ROM.

DVD isn't just for computers. Hollywood movie studios want to replace VHS videocassettes with DVD video in the rental and retail markets. The discs are much cheaper to manufacture than VHS tapes (about 80 cents compared to $2.20), occupy less shelf space, never need rewinding, deliver higher-quality video, and can accommodate multiple-language soundtracks and subtitles.

The music industry is also expressing some interest in the evolving DVD standard. More data means higher sampling rates and longer playing times, so DVDs could surpass the fidelity and convenience of regular CDs.

To ensure the success of this new medium, the computer and entertainment industries are hammering out a worldwide standard. DVDs won't work with existing equipment, of course, but new DVD-ROM drives will read several variations of the DVD format. Optionally, the DVD drives will be designed to also support some future formats that are still evolving, such as write-once DVD-R and rewritable DVD-RAM.

continued



Even though the DVD standard does not mandate backward compatibility, it's highly likely that DVD-ROM drives will read existing CD-ROM and CD Recordable (CD-R) discs. Likewise, the DVD video and audio players sold to consumers will almost certainly play audio CDs and maybe other CD-based formats, such as CD Interactive (CD-I) and CD Video. There's even talk about a hybrid disc that stores data at CD and DVD densities in separate layers on a single platter.

Despite its storage capacity and the array of format choices, DVD faces some serious challenges in the consumer market. For DVD video to catch on, the studios must release enough movies in this format to make the players a worthwhile purchase. Also, it may possibly be several years before recordable DVD video decks appear. They will need real-time MPEG-2 compression to fit 2 hours of video on a disc, and implementing real-time MPEG-2 currently costs tens of thousands of dollars.

Even if you care about DVD only to store corporate data or distribute sales presentations, what happens in the consumer market is quite important. DVD-ROM prices will remain high if there is no consumer market to drive down the manufacturing costs.

The Many Sides of DVD

The most amazing (and confusing) thing about DVD is its plethora of physical formats. There are more than a dozen possible variations, though only a few will likely be popular (see the table "DVD Physical Formats" on page 142). Fortunately, most DVD drives will automatically recognize all formats, so DVDs should be as easy to use as CDs.

The multitude of formats is a radical departure from the CD standard. CDs always store data at the same density on a single-sided disc. The capacity varies only by how closely the outward-bound spiral data track approaches the disc's outer rim. Most CD-ROMs settle for a conservative 553 MB. Some discs stretch it to 682 MB by living close to the edge. It's risky because the outer region of a disc is more susceptible to defects, and some drives have trouble reading the longer track.

DVD achieves its greater capacity in four ways. The first two methods take advantage of improved manufacturing techniques and shorter-wavelength lasers. CDs and DVDs store data in the form of

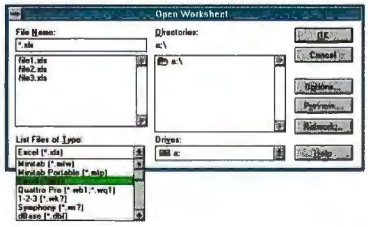
NEW! Release 11 runs on Windows 3.1, Windows 95, and Windows NT – one product, one price!

MINITAB®
Statistical Software.
Master your data with ease.

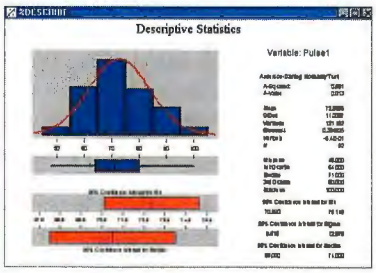
For over 20 years in over 80 countries, users have experienced the power and simplicity of MINITAB Statistical Software. Used in businesses from start-ups to Fortune 500 companies, MINITAB is:

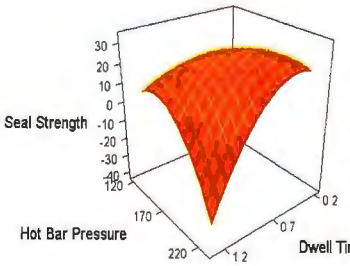
- ***Powerful and comprehensive*** – an "all in one" statistical software package from basic to complex statistical functions
- ***Easy to use*** – with dialog boxes and prompts every step of the way
- ***Easy for data entry or importing*** – enter data into MINITAB worksheets or import data from Excel®, Lotus® and other programs
- ***Ready to use right out of the box*** – with MINITAB Statistical Software, there is no lengthy learning process and a simple and quick tutorial gets you working right away
- ***Available on multiple platforms*** – MINITAB Statistical Software runs on Windows® '95, Windows® 3.1, Windows NT™, Macintosh and Power Macintosh
- ***Fully supported*** – on-line HELP is easy and quick plus skilled technical specialists are just a phone call away
- ***Affordable*** – priced under US $1,000
- ***Guaranteed*** – when you purchase directly from MINITAB, you receive our unconditional 30-day, money-back guarantee

Moving data between MINITAB and other packages, including Excel and Lotus is a breeze

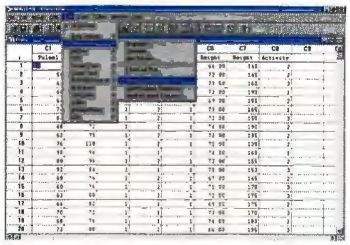


With MINITAB's wide range of analytical tools, you have complete flexibility in analyzing your data.

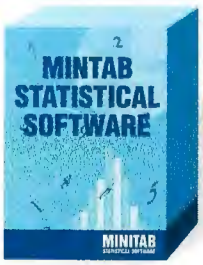




Your data comes alive quickly and attractively with MINITAB's presentation graphics.



MINITAB has pull-down menus for all of its statistical capabilities. Just click and work with your data!



MINITAB Statistical Software runs on Windows '95, Windows 3.1, Windows NT, Macintosh and Power Macintosh.

microscopic pits that represent binary ones and zeros. On a CD, the minimum length of a pit is 0.834 micron; on a DVD, it's reduced to 0.4 micron. This lets the disc-mastering machinery squeeze the pits more closely together.

In addition, the data track that spirals outward from the center of the disc is spaced only 0.74 micron apart on a DVD; the track pitch on a CD is 1.6 microns. To read these smaller pits and tighter tracks, DVD drives use a red laser at a wavelength of 635 to 650 nanometers; CD-ROM drives use an infrared laser at 780 nanometers. The red-laser diodes in DVD drives are identical to those in bar code readers (see the table "Comparing CD-ROM and DVD-ROM" on page 144).

Reducing both the pit size and the track pitch increases the disc's capacity about sevenfold: 4.7 GB for DVD compared to 682 MB for CD. Mindful of the unquenchable demand for mass storage, however, DVD designers (Philips, Sony, Toshiba, and Matsushita deserve most of the credit) adopted two additional strategies: dual layers and double sides. Each enhancement is optional.

Dual layering is the most impressive technology. All CDs and DVDs have a layer of reflective material (which is usually aluminum) immediately behind the pitted polycarbonate substrate. The reflective layer bounces the laser back to the photodetector. Dual-layer DVDs have a semireflective layer on top of the fully reflective layer, and the lasers in DVD drives can read each layer separately.

This technique almost, but not quite, doubles the capacity of a disc. The lower reflectivity of the second data layer limits it to about 3.8 GB, compared to 4.7 GB in the fully reflective layer. That's why dual layering yields 8.5 GB per side instead of 9.4 GB.

If that's not enough for you, DVDs can also store data on both sides. Double-sided discs have two polycarbonate substrates bonded back-to-back, and each substrate may contain one or two layers of data. It's even possible to bond a single-layer substrate with a dual-layer substrate. Therefore, the total capacity of a double-sided DVD-ROM can range from 9.4 to 17 GB.

Double-sided DVDs have some drawbacks, however. Ordinary disc labels are opaque to lasers, so double-sided discs require a special holographic label that's difficult to see in dim light. Also, double-sided DVDs are more vulnerable to surface damage, because both sides contain data and the substrates are thinner.

DVD Physical Formats

DVD format	Capacity (120-mm disc)	Capacity (80-mm disc)
DVD-ROM: one side, one layer	4.7 GB	1.4 GB
DVD-ROM: one side, two layers	8.5 GB	2.6 GB
DVD-ROM: two sides, one layer	9.4 GB	2.9 GB
DVD-ROM: two sides, two layers	17 GB	5.3 GB
DVD-R: one side, one layer	3.9 GB*	1.2 GB*
DVD-R: two sides, one layer	7.8 GB*	2.4 GB*
DVD-RAM: one side, one layer	2.6 GB*	0.7 GB*
DVD-RAM: two sides, one layer	5.2 GB*	1.5 GB*

*BYTE estimate; industry standards are not yet finalized.

Wait, There's More

The options for single- or double-sided discs and single- or dual-layer sides raise the possibility of at least five physical formats—but DVD doesn't stop there. Another variation is DVD-R, expected to debut late next year. This is a write-once format similar to CD-R that replaces the read-only polycarbonate data layer with an organic dye. DVD-R drives can record data by burning spots in the dye. However, due to the limitations of this material, single-layer DVD-R discs will have somewhat less capacity than single-layer DVD-ROMs (about 4 GB compared to 4.7 GB). Also, this material is not as suitable for making dual-layer discs.

DVD-RAM, expected to debut in 1998, encodes the data on a rewritable phase-change material. It will have even less capacity than DVD-R, probably topping out at 2.6 GB per side. According to Arjen Bouwman, DVD marketing director at Philips, DVD-RAM shows more promise for dual layering than DVD-R, but the first DVD-RAMs will almost certainly be single-layered.

The DVD standard also provides for discs that are 80 mm in diameter instead of 120 mm. Although they have about 70 percent less capacity, the smaller discs may find a home in mobile devices. Like their 120-mm cousins, they can be single- or dual-layered, single- or double-sided, and recordable or rewritable.

Just to keep things interesting, the industry is also talking about DVD drives that could read discs at a constant angular velocity (CAV) as well as a constant linear velocity (CLV). Currently, the CD and DVD standards use CLV to maintain a constant bit rate; rpm gradually increase as the drive reads the inner (shorter) tracks.

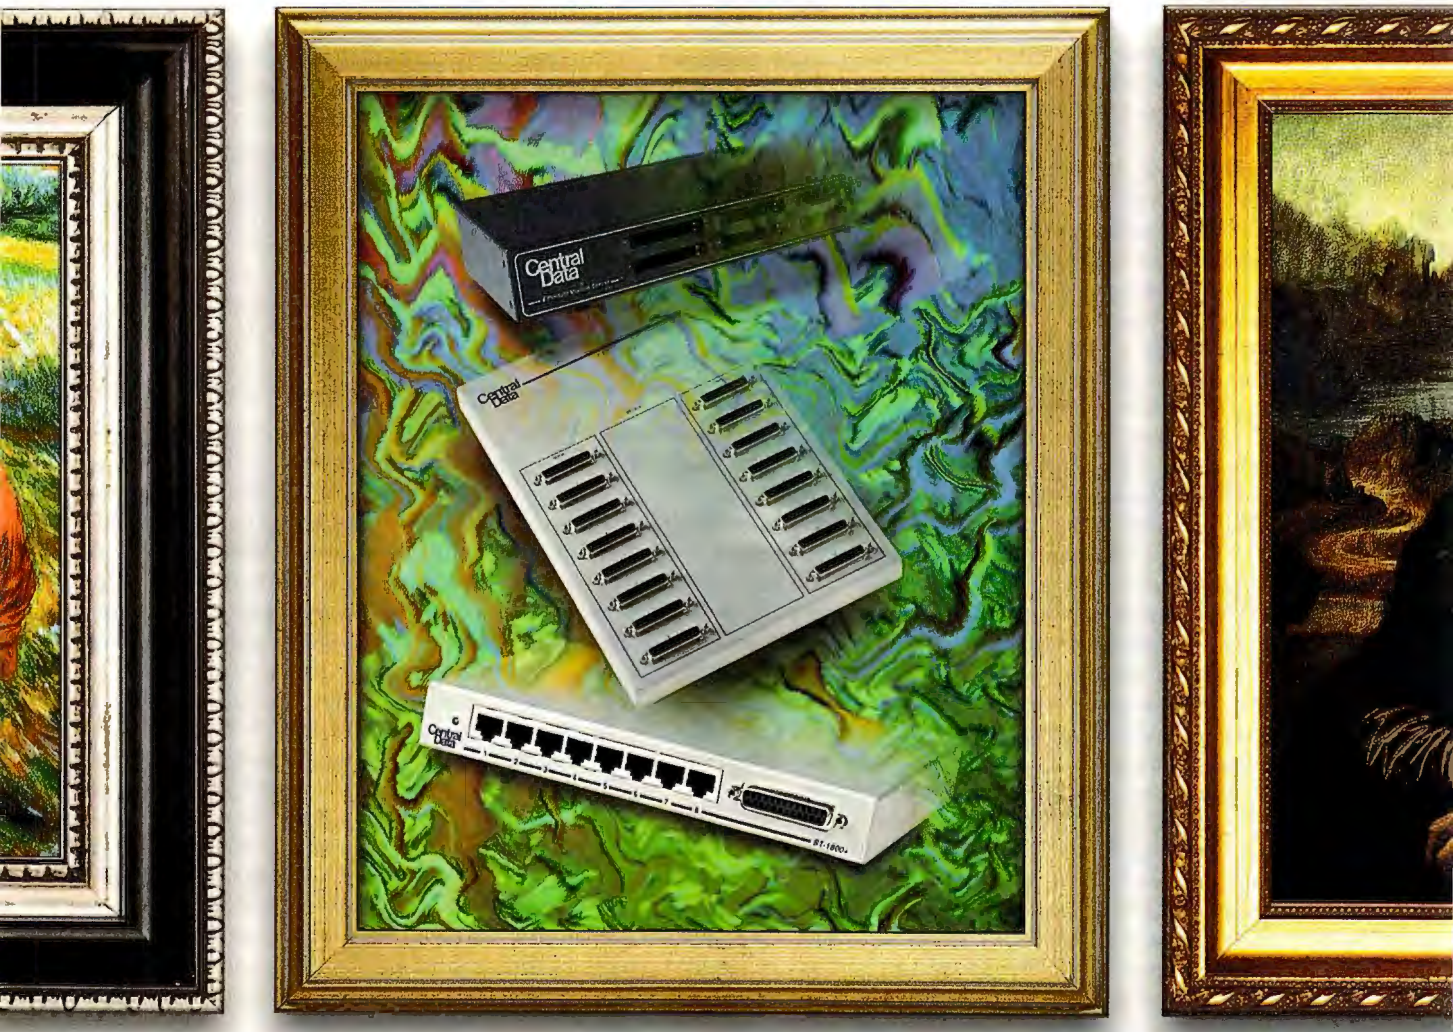
In a CAV drive, however, rpm would remain constant, no matter which part of the disc the laser is reading. Throughput would decrease when reading sequential data from the inner tracks, but the trade-off would be faster access times, because the drive wouldn't have to speed up or slow down when it's switching tracks. CAV drives would be better for applications that rely on random access, such as databases.

Yet another possible format is the hybrid CD/DVD. This disc would overlay a semireflective DVD layer on top of the fully reflective CD layer. The shallower DVD layer (0.6 mm) would be effectively transparent to existing CD-ROM drives and CD audio players, whose infrared lasers would focus on the deeper-layered CD data (1.2 mm). Thus, a hybrid disc could work on both types of drives.

Hybrid drives that read both CD and DVD discs are another possibility, though they're not required by the DVD standard. To avoid the cost of two laser diodes (red and infrared), Mitsubishi has designed a mechanism that swings two different lenses into the path of the laser beam, changing its wavelength from 635 to 780 nanometers. Another clever solution, devised by Matsushita, beams the laser through an aspheric molded-glass lens that has a special holographic pattern on its surface. The holographic pattern modifies the laser's wavelength for either CD or DVD by diffracting the beam.

At this writing, it was too early for us to test DVD-ROM drives and discs for multiformat compatibility. This will obviously be an important consideration when choosing a DVD-ROM drive. *continued*

SERIAL PORT ORIGINALS



At Central Data, serial communications is not a side business. It's our only business. This dedication has inspired a collection of "originals" for UNIX® and Windows NT™ not found anywhere else. If we don't have exactly what you need, send us your specs. We specialize in OEM and custom solutions.

Our high-speed scsiTerminal Servers™ and *EtherLite*™ Port Servers allow you to add from two to hundreds of *real* (not pseudo) serial ports. Without network configuration hassles. And without using any card slots.

Adding modems? Reduce the normal cabling mess with our streamlined SCSI and *EtherLite* Modem Servers. They connect up to 16 PCMCIA modems in a single box.

If you're looking for PCI boards, try our new 4- and 8-port serial cards. They're our lowest-cost solutions ever.

To fully appreciate our Serial Port Originals, evaluate one FREE for up to 30 days. Call **1-800-482-0397**. Or view our website at **http://www.cd.com/**. See how Central Data has turned UNIX and NT connectivity into a work of art.

Pair Bonding

Why are there so many DVD formats? Blame the industry's long-running battle over DVD. Two alliances tried to unilaterally establish the new standard. One group, led by Sony and Philips, favored a single-sided/dual-layer disc. The other group, led by Toshiba and Time Warner, favored a double-sided disc. To avoid a format war reminiscent of the Beta-versus-VHS debacle of the 1980s, the computer industry worked with Hollywood to reach a compromise. As a result, the DVD standard inevitably bears some marks of a technology that was designed by committee.

For example, if you closely examine a single-sided DVD, you'll notice it has two polycarbonate substrates bonded back-to-back, just like a double-sided DVD. The only difference is that one substrate is a blank dummy.

This happened because the Toshiba/Time Warner alliance insisted on a double-sided option, which requires back-to-back bonding. Each substrate is 0.6 mm thick; after bonding, the total thickness is 1.2 mm. To be compatible, a single-sided DVD must also be 1.2 mm thick. However, it can't use a 1.2-mm substrate, because the laser expects to find the data at a depth of 0.6 mm. Thus, a single-sided disc must have two 0.6-mm substrates, even though only one substrate stores data.

Sony and Philips argued that bonded discs are more expensive to manufacture, and users have to manually flip over a double-sided disc to read the other side. (Conceivably, a DVD drive could have a separate laser for each side, but this would nearly double the cost and complexity of the drive. Moreover, it would make it too bulky to fit in a standard drive bay.) Toshiba and Time Warner argued that disc bonding is a mature technology (it's been done for years with 12-inch video laserdiscs) and that double-sided DVDs have more capacity. Ultimately, the latter argument won.

Fortunately, one thing that everybody involved agreed on is a standard *logical* format. Up to now, I've been talking about *physical* formats: the methods of physically storing data on the disc. The logical format is the disc's file structure. All DVDs will obey a standard that's called the Universal Disk Format (UDF), which is a subset of the ISO-13346 standard for data interchange.

With UDF, it should be easier to create a single disc that works on multiple OS platforms, including DOS, Windows, Windows NT, OS/2, the Mac OS, and Unix. When these OSes add support for UDF—in the form of a new driver or extension—they will be able to recognize any DVD. UDF essentially abstracts OS-specific features like filename conventions, extended file attributes, byte ordering, and Mac resource forks. Executable programs are still platform-specific, of course, but at least the data is portable.

To help bring developers up to speed on UDF, the Optical Storage Technology Association publishes a technical white paper on its Web site (see the "Where to Find" box).

Just in case some OSes don't immediately support UDF, some early DVD-ROMs may be "bridge discs": They will have both UDF and ISO-9660 file structures pointing to the same data. (ISO-9660 is the CD-ROM standard.) DVD video players, however, will recognize only a special subset of UDF known as Micro UDF. It's basically the same as full UDF, except the video player looks for files in one particular subdirectory. This lets developers mix video and computer data on one DVD that's playable on either a consumer video deck or a DVD-ROM drive. For example, Disney could release *The Hunchback of Notre Dame* and a computer game based on the movie on a single disc.

With so many possibilities, DVD deserves its nickname digital versatile disc. But its versatility could also be a vulnerability. Can the numerous companies that are pulling DVD in so many directions settle their remaining differences and produce drives that are as versatile as the discs? Achieving full compatibility with all of DVD's physical formats won't be trivial, and most users will want backward compatibility with their CDs, too. That will be the real test.

If vendors can deliver on their promises, DVD seems like a no-brainer for computer users and developers who are eager to make the transition from megabytes to gigabytes. B

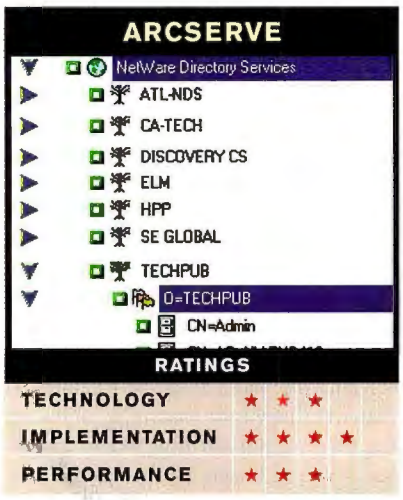
Comparison

Replica and ArcServe take vastly different approaches to meet the network-backup challenge. ***By Steven J. Vaughan-Nichols***

Net Saviors

Somewhere in the fog of your memory, along with 1980s rock bands and single-server networks, you probably remember when you could back up a network onto 250-MB quarter-inch-cartridge (QIC) tapes. Perhaps you even recall the days when you could bring down your NetWare or Windows NT network during the middle of the night for backup.

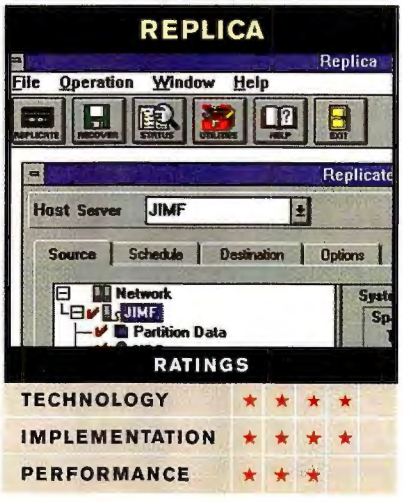


Today, if your storage media can't handle at least a gigabyte per tape, you're wasting time swapping out tapes. As for bringing down the network for backup, fat chance. In today's office, workers are just as likely to be running applications from Hong Kong hotel rooms at 2:00 a.m. local time as they are during business hours. A good enterprise network never goes down.

As you can see, backup is different today, and it needs different software. Heterogeneous networks are the norm, and intranets are taking over the LAN world. With a large LAN, you may very likely have several different servers providing backup services with just as many backup media devices. Thus, you need backup software that can not only speak different computer dialects but also cope with different tape formats. Last, but far from least, the software must be able to catalog and track them all in a centralized database. If you have a NetWare-based LAN, you need *client agents*—small programs that enable "foreign" systems (running anything from the Mac OS to Unix to Windows 95) to hook up with the backup program.

BYTE has tested a couple of products that satisfy these massive requirements: Cheyenne Software's ArcServe 6.0 and Stac Electronics' Replica 2.1. Both programs are primarily NetWare oriented; however, each is also available in an NT-server version.

These two programs take vastly different approaches to network backup. ArcServe, honed by years of experience, employs a standard file-by-file backup and recovery system, while relative newcomer Replica mirrors entire NetWare volumes. Besides this major difference, there are a number of other small dissimilarities between the programs. Each approach has its advantages for particular situations.



Cheyenne ArcServe 6.0

ADVANTAGES

+ Fastest file-based backups
+ Multithreaded backup agents
+ Can do RAID 5 backup

DISADVANTAGES

– Expensive

Although ArcServe has been around in some form for nearly as long as NetWare, version 6.0 isn't your father's ArcServe. This new version comes with a host of new features, the most important being what Cheyenne calls Push Agents.

Unlike agents that supply you with data from non-Novell sources, ArcServe's Push Agents manage multiple system-file access. These agents allow multiple data streams, so ArcServe can back up data from multiple servers across the network simultaneously. This, in turn, produces faster throughput. In short, ArcServe works as an honest-to-goodness multitasking, multiprocessing backup system; it's not like the old-fashioned, one-job-at-a-time, batch routine that we all know and hate.

You may wonder whether the existence of multiple Push Agents makes much of a difference when they're all writing to the same storage device. Indeed it does, because ArcServe uses another technique, called *media pooling*, to maximize backup speeds by writing to multiple backup devices at once. The result is the fastest file-to-tape backups we've ever seen.

ArcServe has even more tricks up its sleeve. It can use multiple backup devices as RAID Level 5 devices, so even if you lose one tape out of a backup set, you won't lose any data. RAID 5 takes up more tape space, but it ensures that not one byte of data is lost without ArcServe's noticing it and making the appropriate on-the-fly

★★★★★ Outstanding ★★★★ Very Good ★★★ Good ★★ Fair ★ Poor

repairs. The RAID 5 implementation, a technology that is mainly used with secure servers, raises this program far above the common herd of file-by-file backup programs. If you want utmost reliability, then choose this option.

Stac Replica 2.1

ADVANTAGES

+ Data-mirroring needs fewer tapes
+ Great for mirroring and restoring server volumes
+ Can copy non-DOS data, files, and partitions

DISADVANTAGES

– Network is crippled while program runs
– Better at restoring images than individual files

Replica, on the other hand, roars by ArcServe when it comes to backing up and restoring an entire NetWare volume or directory tree. By mirroring only the data in active file systems, and not simply replicating a disk image sector by sector, Replica leaves older image-backup technology eating its dust. System administrators get a faster system-mirroring solution that needs far fewer tapes.

How fast is Replica? On our 120-MHz Pentium Windows NT server with a Travan TR-4 tape drive, we saw 5 GB per hour go whipping by like mile markers on the highway at 80 mph. And that was with a Travan drive, which doesn't come close to the raw throughput of a digital audiotape (DAT) or 8-mm tape drive.

Interestingly, although Replica works best at the volume/directory-tree level, it can also copy non-volume-specific information, such as an MS-DOS partition, without a hitch. At a time when you need a scorecard to keep track of which machines are using which file systems, it's a true pleasure to have a backup system that doesn't care whether the file system being used is file allocation table (FAT), High Performance File System (HPFS), NT File System (NTFS), or whatever. Replica instantly recognizes the format.

Stac's Object Replication Technology (ORT) also adds flexibility, enabling you to store entire file systems on other servers, tape drives, or even completely different types of storage devices, such as magneto-optical (MO) drives. Better still, Replica can recognize most available storage options, and it automatically presents them to you as possibilities; you don't have to fiddle with configuration files to ensure the program knows about the MO drive here or the 8-mm library over there.

Restoring files is almost fun with Replica. With NetWare, for instance, you use the program to see the backup media as a volume, assign it a drive letter, and use the usual file-copy and move commands.

When you combine this feature with Replica's imaging capacity, you can even perform such miracles as restoring a dead NetWare server with just two disaster-recovery floppies and a copy of your backup media. This is distinctly reminiscent of Unix, where you can run the OS straight off the tape if you're desperate.

Which One Is Best?

These programs are intended for two different audiences. If you want to clearly see the granularity of file systems—such as when you're in desperate need of one particular file—then ArcServe is for you. Its file-searching and restore speeds are great. And its RAID 5 option makes it potentially the safest backup system currently on the planet. Still, you pay a hefty price, both in total backup time and in the $1995 cost of the software.

If you're more likely to want to back up and restore entire systems, even from the brink of server failure, then Replica is what you want. Its major weakness is that, whether you're backing up or restoring, the program will bring other network activity to its knees. Moreover, the program is simply not in the same ballpark as ArcServe for finding and restoring individual files. Still, with its $995 price, you may be able to forgive these sins.

Thus, picking between these two products is both simple and complex; there is no clear editor's choice here. Both are great, but they do somewhat different jobs. You need to analyze your network use carefully to see what your users and your network need most. Only then can you make a reasonable choice between these very different products. But no matter which one you choose, you're going to have a first-rate backup system that should see you through to the end of the century. B

TECH FOCUS BACKUP OPTIONS

Mirror, Mirror, on the Tape...

Still confused about what Stac's Replica does that's different from what Cheyenne's ArcServe does... or from what other backup systems do? Here's a quick guide to popular backup options.

File by file: With traditional file-by-file backup, each file is copied as a single, named entity, regardless of whether it's compressed. This approach makes finding individual files quick and easy, but creating thousands of individual files on a tape in the first place can be time consuming. An analogy can be drawn to a word processing file containing many individual words that can be found and copied without any problem.

Disk mirroring: Traditionally, mirroring software makes an exact copy of a disk, sector by sector. This is easy and fast to do on the backup end. But when it comes to restoring a file, it's almost impossible to find any individual item inside that image quickly. In terms of our word processing analogy, this is like sending a fax. Instead of having a document that's easy to search, you end up with one huge image file that's nearly impossible to search automatically. Worse, the document includes large amounts of white space that you have to transmit and navigate around to get to the words you need. Like image backup, it's easy to handle, but it's almost impossible to find anything within it quickly.

Data mirroring: What Stac does with Replica, in effect, is to combine the best elements of both approaches. Replica makes disk images that don't include the time-wasting white space of ordinary mirroring. Getting to an individual file still isn't as fast as when working with a file-by-file copy, but it's far faster than dealing with an ordinary mirror-style backup. And note, too, that when we say "data mirroring," "data" includes application code.

Siemens Nixdorf's ComUnity aims to turn Visual Basic 4.0 into a client/server environment but falls short. ***By Volker Weber and Hans-Jochen Schmitt***

Enterprise Visual Basic? Almost...

Although Microsoft markets the Enterprise Edition of Visual Basic 4.0 (VB 4) as an enterprise-level client/server tool, the product still lacks the high-level business-logic tools of such client/server mainstays as PowerBuilder.

Now, along comes Siemens Nixdorf, the German computer company, with a major effort to provide an overarching framework for client/server development that exploits VB 4's open programmable objects. Called ComUnity, the framework prescribes how to build distributed client/server applications. The related development environment is called the Open Technology (OT) Framework, which in its first incarnation works with VB 4. Siemens Nixdorf plans to port it to other languages, including C++. Our examination of a beta version revealed an ambitious product that nonetheless falls well short of its goals.

ComUnity OT Framework's Tailoring Tool lets users modify a custom application's UI.

Members of the ComUnity

ComUnity consists of a three-layer application model that comprises a Presentation Layer, a Business Logic Layer, and a Database Layer (see the Tech Focus figure on page 150). This model, like other three-tier architectures, offers advantages in scalability, usability, maintenance, and performance compared to monolithic applications. You can distribute the layers across a network, with the Presentation Layer on users' desktop computers, the Business Logic Layer on an applications server, and the Database Layer on a database server.

RATINGS	
TECHNOLOGY	★ ★ ★ ★
IMPLEMENTATION	★ ★ ★

To implement ComUnity's architecture in VB, Siemens Nixdorf had to employ Microsoft's standard development tools, including VB 4 itself, Microsoft Visual C++ 2.2, and OLE components. But because these tools are best suited for small-scale software projects, Siemens Nixdorf added more tools to improve support for large projects.

Inside the OT Framework

Central to OT Framework's Database Layer is a relational data dictionary that serves as a central repository where all the tables, attributes, and relations are managed. From the data dictionary, OT Framework generates Open Database Connectivity (ODBC) data sources, migrates databases, generates SQL statements for data access, and even produces simple entry forms for the user interface.

Unfortunately, even though you can manage the data dictionary with a simple data-entry and maintenance tool, OT Framework provides no graphical representation of the data-dictionary information. It does, however, import data models produced with CASE tools, such as Microtool's CASE 4.0 and IBM's Mood.

The data dictionary becomes part of the run-time environment repository that's distributed with OT Framework applications. Because the data dictionary contains information on the relationships between tables, applications can provide for relational integrity even if the underlying database has no such provisions.

The Presentation Layer, which establishes the user interface (UI), is built around VB 4. A forms generator uses the data-dictionary information to generate default VB 4.0 data-entry forms. You can customize these forms, but they also work with real data right out of the box.

OLE Automation acts as the glue between the Presentation Layer UI and the Business Layer. Perl scripts link code and single UI controls, but the program generates them automatically, so users don't have to deal directly with Perl. A cross-checker monitors the UI forms against

TECH FOCUS | ARCHITECTURE

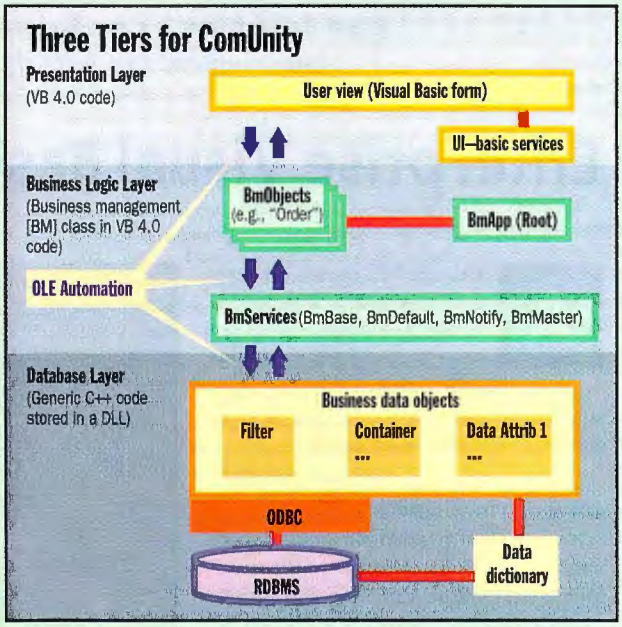
Linking Tiers with Remote OLE

Divide et impera (divide and rule)—splitting applications into three parts—is the state of the art in client/server technology. Modern client/server applications, such as SAP's R/3, use a Presentation Layer (for realizing the user interface) and a Database Layer (for storing persistent data), which are held together by a Business Logic Layer. For performance or maintenance reasons, the different layers can be implemented on distributed systems in a network.

To a programmer, the problem is not whether to split the application, but to choose a distribution technology that allows the parts to communicate over a wide range of networks and OSes. Remote procedure calls (RPCs), Common Object Request Broker Architecture (CORBA), and IBM's Distributed System Object Model (DSOM) are possible solutions. With Visual Basic 4.0 (VB 4) Professional Edition, Microsoft has offered yet another option: Remote OLE.

Remote OLE allows OLE servers and clients to be distributed over a Windows-based network. Instead of invoking OLE server methods on a local machine, the OLE client sends OLE requests over the network to a remote OLE server. Siemens Nixdorf chose Microsoft's Remote OLE as the primary communications technology for distributed, three-tier, client/server applications. Therefore, applications built with ComUnity OT Framework are implemented as VB 4 OLE servers, and thus they can be distributed fairly easily via Remote OLE.

The only catch to this elegant Remote OLE solution is its incompatibility with non-Windows environments.



Implementing ComUnity applications as OLE servers lets them communicate over a network.

any modifications in the data dictionary.

The forms are stored in the run-time repository, and you can use OT Framework tools to further customize the UI by working on the forms data. Users can use the Tailoring Tool (see the screen on page 149) to customize the UI: data-entry fields can be switched off, changed, or moved, even in the delivered version of an application. Developers who are skittish about giving users this much control over the UI can turn the tailoring tool off. Regardless of whether a site contains some highly individualized UIs, centralized program updates can merge with them seamlessly.

Putting It All Together

As the Tech Focus figure indicates, the glue between the UI and the database is the Business Logic Layer. OT Framework implements this layer in VB 4 code using the new VB 4 class concept. This pseudo-object-oriented feature allows you to define reusable classes and instances, but it doesn't support inheritance or polymorphism. OT Framework comes with predefined classes for UI handling and general-purpose business applications, such as order entry.

The application framework itself is a template-based VB data dictionary called Code Wizards. Regrettably, except for a run-time debugger, there are no tools in the Business Logic Layer—you're on your own as far as business processes are concerned. Thus, any higher-level knowledge must go from paper directly into VB code.

An Incomplete Toolkit

If you're not familiar with the VB environment, ODBC data sources, or tool-based software development environments in general, installing ComUnity can be a bit daunting. The beta version of the setup routine had some rough edges; the ODBC data sources for the data dictionary and the target applications are not added automatically. You must also add the VB Code Wizards and Form Wizards manually to the VB environment.

From a lone developer's point of view, OT Framework's major advantage is its vast library of reusable VB code for business applications software. The tool is rather loosely integrated with the VB environment. For small-scale projects, it does not go much beyond VB 4 or other add-ins and components that are on the market.

ComUnity also lacks an integrated version-control and project management tool. It relies on Microsoft Visual Source Safe, which comes bundled with the VB 4 Professional Edition, for version control. But Siemens Nixdorf says it's working to integrate Microsoft Project into a future version of ComUnity OT Framework.

Missing from this first implementation of the ComUnity architecture are integrated Upper-CASE tools, such as data modelers and object-oriented modeling tools. Sinking the whole business logic into pure VB code is asking for trouble, especially if users ask for changes in the application.

As long as you equate cross-platform development with Windows 95 and NT on Intel platforms, you'll have no problems with OT Framework. Its VB-centric approach restricts you to those platforms.

In the final analysis, ComUnity OT Framework caters to very specific needs. If you're a VB developer building large-scale business applications and are willing to learn a new application framework, give version 1.0 of ComUnity OT Framework a closer look. Everyone else should take a pass on it for now. B

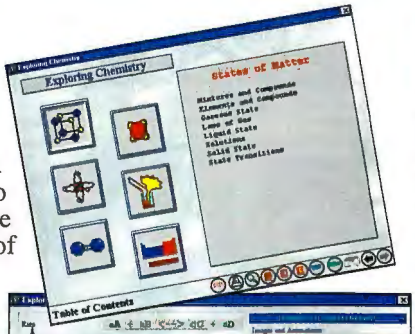
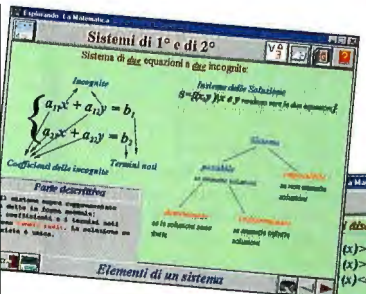
EXPLORING...

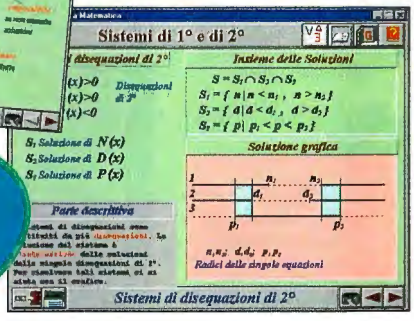
The EXPLORING series is a multi-media collection for Secondary School students, designed specifically to help them learn in a simple and intuitive manner. It is not intended solely for students but also for anyone wanting to increase and broaden their knowledge of a specific subject. The user can learn all the information either by following the topics step by step or by navigating through the contents. Learning is pleasant and the results are guaranteed thanks to particularly sophisticated multi-media techniques, such as the use of graphics for a more effective understanding of the contents, hypertext links for moving from a given topic to other related ones and helpful functions for searching for the best-known terms.

EXPLORING CHEMISTRY FOR WINDOWS

EXPLORING CHEMISTRY contains a large number of topics, which include: the laws of chemistry; Lavoisier, Dalton and Proust; the weighted balance of chemical reactions; matter; pure substances and mixtures; elements and compounds; atoms and molecules; atomic models; the orbital quantum model and chemical bonds. It is also possible to select the elements on the basis of their chemical and physical properties and to make a comparison of the data for several different elements by creating a graph.



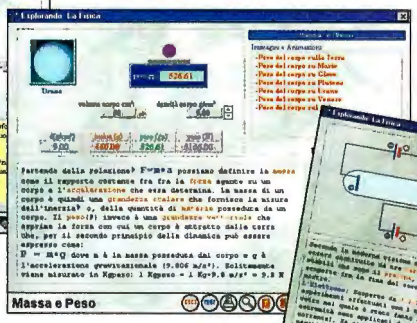




only $ 39 each title

EXPLORING PHYSICS FOR WINDOWS

EXPLORING PHYSICS is split up into several learning units covering the main topics of physics: the measurement of physical magnitudes; units of measurement; the analysis of experimental data; from the analysis of data to physical laws; speed, acceleration and force; equilibrium in stiff bodies and fluids; energy, temperature and heat; and electricity and the related phenomena.



EXPLORING MATHEMATICS FOR WINDOWS

EXPLORING MATHEMATICS covers a range of many different topics: sets and their relationships, classes of equivalence, real and non-real numbers, operations and properties, algebraic expressions, monomials and polynomials, logical operations, equations and disequations, systems of equations and disequations and their performance, 1st and 2nd degree equations, radicals, parametric equations and biquadratic equations.

As a member of the *Computer Professionals' Book Society*... you'll enjoy receiving Society bulletins every 3-4 weeks containing exciting offers on the latest books in the field at savings of up to 50% off the regular publishers' prices. If you want the Main selection, do nothing and it will be shipped automatically. If you want another book, or no book at all, simply return the reply form to us by the date specified. You'll have at least 10 days to decide. If you ever receive a book you don't want due to late delivery of the bulletin, you can return it at our expense. And you'll be eligible for FREE BOOKS through the Bonus Book Program. Your only obligation is to purchase 3 more books during the next 2 years, after which you may cancel your membership at any time.

All books are softcover unless otherwise noted. Publishers' prices shown. If you select a book that counts as 2 choices, write the book number in one box and XX in the next. A shipping/handling charge & sales tax will be added to all orders.

BYP1096

Powersoft's Optima++ makes C++ client/server development a drag-and-drop dream. By Rick Grehan

A C++ Tool That Cures VB Envy

In spite of all the complaints about Visual Basic (it's slow, it's only somewhat object-oriented), you have to love how easy it makes building user interfaces (UIs). Wouldn't you like to have the same building-block-style environment in a C++ package?

Powersoft's Optima++ is about as close as you'll get... for now. It is a rapid application development (RAD) system for Windows 95 and NT that incorporates the best of current Windows development systems. Look at who's contributed genetic material to its conception: Watcom, producer of one of the best C/C++ compilers for Intel platforms; Sybase, a database organization of considerable repute; and Powersoft, creator of the PowerBuilder fourth-generation language (4GL) development system. The result is a combination UI builder, client/server database construction kit, and general-purpose C/C++ compiler that will probably have Delphi and VB developers sneaking peeks over the shoulders of Optima++ users.

Just Up the Road

Soon-to-be-released editions of Optima++ will include:

- Sybase SQL Anywhere (four-user version)
- Internet components
- Integrated support for Java
- Team programming
- Native database drivers

Cultured Drag and Drop

Optima++'s most elegant feature is without doubt its drag-and-drop programming. The designers have turned on-line help into a *reference card*, a kind of souped-up hierarchical help system structured in outline form. The upper-level branches of the outline consist of the object categories understood by Optima++: database objects, graphics objects, menu objects, and so forth. The leaves are the object methods.

The reference card is much more than a static help mechanism. For example, associated with any visual object (say, a button) on a form is source code for handling events that the object receives. Open a window to that source code, grab any other visual object (say, a listbox), and drag that object into the source code window. This will cause Optima++ to open the reference card, properly positioned to the methods associated with that listbox. With just a few more mouse-clicks, Optima++ will automatically write the source to invoke the selected method for you.

Components and C++

Drag-and-drop programming is only part of Optima++'s allure. Because it uses a construction-by-components paradigm, you'll find nonvisual components as well as visual ones (e.g., database query components and transaction components). Optima++ can also incorporate OLE Controls (OCXes) into its component toolbars, which means it also creates entries in the reference card for each OCX. Consequently, you manipulate OCXes in the same way as the native components supplied with Optima++.

Finally, because Optima++ is, after all, a C++ development system, it wraps a number of system services in easy-to-handle classes (e.g., thread objects). Its debugger is as full-featured as any I've seen, going so far as to include a memory tracker, which can locate a number of memory-related bugs. The memory tracker's coverage ranges from simple leaks to more elaborate validity checks on objects such as strings and Graphical Device Interface (GDI) handles.

What's Ahead

At the time of this writing, only Optima++'s Developer Edition was in release. Professional and Enterprise Editions will appear soon (see the text box "Just Up the Road"). If the upcoming editions are as well done as the Developer Edition, they could well be the stepladders that many VB developers need to begin their ascent to the otherwise frightful altitudes of C++ programming. With Compaq's Armada 4100 family, you build the notebook you need. ***By Dave Rowell***

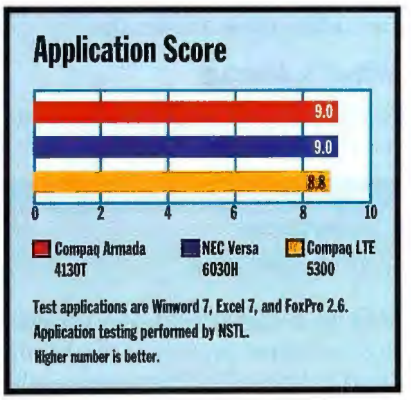
Notebook Under Construction

I love Compaq's new Armada 4100 notebooks for many reasons, but particularly for their configurability. Compaq has taken the concept behind Digital Equipment's HiNote Ultra II notebooks and run with it.

The standard 6-pound, 1.5-inch-thick configuration has an internal floppy drive, but the battery is in the sturdy handle, which can prop up the rear 10 degrees or fold up to protect the I/O ports in transit. Remove the handle and replace the modular floppy drive with a $199 battery module, and you have a 5-pound slim-line notebook. Two screws with D-ring loops make the handle attachment easy and secure.

Going the other way, you can attach the optional $399 CD-ROM base and have an 8.2-pound multimedia notebook. The base holds a 4× CD-ROM drive, two more (larger) stereo speakers, and a bay for another battery. Remove the floppy drive, and the notebook can hold three lithium-ion batteries for a really long flight.



In any configuration, an Armada 4100 is bulkier than a HiNote Ultra II, but it's also more functional, holding floppy and CD-ROM drives simultaneously, for example. The Armada's magnesium-alloy frame gives it strength and conducts heat from the processor. Compared to Compaq's larger LTE 5000 series, the Armada 4100 notebooks lack the option of a full docking station with drive bays. They can, however, attach to a port-replication base (with or without the CD expansion unit) that has an Ethernet port.

Pricing is competitive, starting at $2599. I tested the high-end Armada 4130T, which costs $4599 and includes a 133-MHz Pentium, 16 MB of RAM on the system board, an 11.8-inch active-matrix color display, and a 1.08-MB hard drive (the current maximum). With the CD-ROM expansion base and an extra battery, I was up to $5197. You can add up to 32 MB of additional RAM using two dual in-line memory module (DIMM) sockets. All models come with 256 KB of 9-nanosecond static RAM (SRAM) cache, a PCI bus, full video and audio ports, speakers and a microphone, an infrared port, and zoomed-video-enabled PC Card slots.

Displays are upgradable. Compaq designed the 4130T's 11.8-inch, 800- by 600-pixel active-matrix color display with a limited horizontal viewing angle, which is better for plane flights than conference rooms. Less expensive models can have 10.4- or 11.3-inch dual-scan displays. You get your choice of pointing devices. Armada 4100 notebooks come standard with a Cirque-type touchpad, but you can order it with a trackball and swap out one for the other.

The four programmable keys along the top left of the keyboard are surprisingly useful. A Compaq extension to the keyboard control panel lets you assign a program to each key, choosing from a list of all runnable programs. You can press a key to launch Explorer, for example.

Compaq adds some nice touches to the Windows 95 environment. A slick power management control panel offers many sensible options, like AC power management, that are easy to figure out and modify. Compaq's diagnostics program tells you more things about your computer than you'll ever want to know.

In performance, the Armada 4130T ties the NEC Versa 6030H, the performance winner in this month's NSTL Hardware Lab Report (see page 114). In design, Compaq has really hit a sweet spot. I expect the Armada to be both admired and copied. B

Call the Observer and get the Picture

What's going on? What is the traffic like today? The Observer can provide instant answers for professionals in any business. Whether you work for the road traffic administration, a security company, the police, or are just an ordinary commuter, you can get a bird's eye view of any situation. Simply call the Observer from your laptop or desktop PC, or arrange for the Observer to call you.

The Observer - your intelligent eye
The Observer offers a wide range of practical applications for security companies, banks, post offices, railroads etc. Perhaps the Observer is exactly what you've been waiting for to give your WWW site a visual dimension? The number of applications is limited only by your imagination. Remember: The Observer is a tiny computer built into a camera, offering an extremely versatile combination.

This is the Observer
The MRT Observer consists of: A video camera (monochrome or full color), a 486 PC with 8 MB RAM and a Hard Disk. The entire system is miniaturized: H: 55 mm x W: 73 mm x L: 250 mm. The Observer is 100% PC compatible and can be supplied with Windows,DOS pre-installed. And for communication, you can choose from the open market and install ISDN, GSM, modem or network PC card (PCMCIA) type I or II.

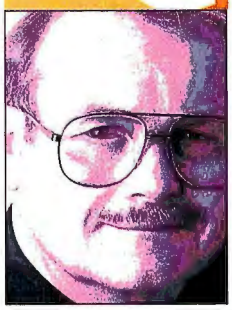
Jerry Pournelle

Chaos Manor



Of Zip and Spam and NT 4.0

Jerry finds new uses for removable drives—once he gets SCSI drive assignments under control.

The worst prediction I ever made was that using spinning metal for mass storage would go away. "Silicon is cheaper than iron," I said. That hasn't happened. Mass storage, like memory, has become so cheap that anyone who loses work because it wasn't backed up deserves what happened.

You can add mass storage by getting a big hard drive and adding it to your system. That's worth doing, but there's an easier way.

The Iomega parallel Zip drive has become something between a standard and a necessity. Attach it to the parallel port of any PC, run one "guest" program from a floppy disk or your hard disk, and you have a 100-MB removable-cartridge drive to use for backup and file transfer. It's extremely well behaved, attaching itself as the next unused drive letter, and it leaves no residual problems when you disconnect it.

The last time I talked about the parallel Zip drive, I casually said "alas, no Mac." Since a Mac has no parallel port, that seemed obvious enough. I have since got a ton of e-mail, some polite, reminding me that the SCSI version of Iomega's Zip drive works just fine with Macs.

Some of the mail was nasty. I know a columnist who swears he will never again mention Macs because he's weary of the hate mail he gets whenever he writes anything but fulsome praise about the Mac. Although I guess I have a bit thicker skin, really, people, you do your cause no good this way. Save your hate mail for your enemies, or better yet, for archiving before you send it.

Anyway, I have a SCSI Zip drive, and, indeed, it works with Macs. With System 7.5's PC Exchange (or a similar utility), the Mac can read DOS-formatted Iomega disks, so you can use the Zip drive as a convenient sneakernet with backup for transferring data files between Macs and PCs.

The SCSI drive is a lot faster than the parallel drive. It took 6 minutes to transfer 44 MB (some big files, lots of small ones, a complex subdirectory structure) from a hard drive to the parallel Zip drive; doing the same operation with the SCSI Zip drive took just under 2 minutes. Writing that 44-MB directory from the parallel Zip drive to a hard drive took about 5 minutes, as opposed to about 1½ minutes with the SCSI Zip drive. If you're after speed, or you want to transfer from a PC to a Mac and back, clearly you'll want the SCSI version. On the other hand, if what you want is backup and convenient file transfer among PCs, the parallel version is preferable.

Anyone who loses work because it wasn't backed up deserves what happened.

The SCSI Zip drive will run off any standard SCSI controller, or you can buy Iomega's SCSI controller card, which appears to be a standard Adaptec SCSI-1 card. Installation for using it with the Zip drive is well documented. My advice is to get an Adaptec SCSI-2 card, but the Iomega card will certainly work. Installation of a SCSI card is simple provided you have a free interrupt request (IRQ). DOS-only systems don't need an IRQ.

For my first test, I connected the SCSI Zip drive to the SCSI outlet of the Distributed Processing Technology caching drive controller on Pentafluge, the Pentium 60 system we built a couple of years ago. This is an older controller that requires a jumper setting to activate the external SCSI port. I long ago set it to make the external port active and keep a Granite Digital SCSIVue Active Diagnostic Terminator on the port when no other device is attached, so I don't have to go inside Pentafluge to install a SCSI string.

It would have been a lot simpler if I'd had the right cable; alas, the SCSI output on Pentafluge's controller is a standard 50-pin SCSI-2 connector, while the Zip drive wants a DB-25 cable. The cable that comes with the SCSI Zip drive is a male-to-male DB-25 that looks exactly like a heavy-duty parallel-port cable.

Of course, the potential for accidentally plugging the SCSI Zip drive into a parallel port, or the parallel Zip drive into a SCSI port, is pretty high. I don't know what would happen, but I sure wouldn't want to try it.

Pournelle's first law of making SCSI work: start with Granite Digital SCSIVue Gold Diagnostic Cables and don't change to anything else until you have everything working properly. Granite Digital makes the High Density MicroD 50/DB-25 Cable, a SCSI-2-to-DB-25 cable, but I didn't have one and didn't want to wait. Thus, I connected the Pioneer DRM-624X six-disc CD-ROM changer to Pentafluge with one Granite Digital cable and used a Granite Digital 50 Centronics/DB-25 Cable to daisy chain the SCSI Zip drive to that. The SCSI Zip drive has a switch on the back to set termination: it was the last drive in the SCSI string, so I set it to "on."

The Zip drive also has a switch that sets it as SCSI ID 5 or 6; I set it to 6. Then I brought up the system with no cartridge in the drive and with the DRM-624X turned off and thus inactive. *continued*

Windows 95 (Win 95) came up fine, ignoring the DRM-624X as it should. There was one hitch. Pentafluge has logical hard drives C and D, a Maxoptix T3-1300 optical drive as E, and the CD-ROM drive as F. The SCSI Zip drive had taken over the F slot, moving the CD-ROM drive to G. I described a similar experience with the Syquest EZ135 SCSI hard drive in the June column. I got quite a bit of e-mail from people telling me, with various degrees of politeness, that SCSI drives take over in the order of their SCSI ID number, so I'd hoped that setting the SCSI Zip drive to ID 6 would prevent that shift. Alas, that turned out not to be the case.

Once I had the SCSI Zip drive operating, I timed some massive file transfers across the network and then shut down the system.

I got the "Please Wait" message. After about 5 minutes, it was pretty obvious that nothing else would happen, so I cut the main power. When I turned it back on,

The system came up on the third try, and Lo!, the drives were really out of order.

Pentafluge trundled for a while and then Win 95 announced there were problems with the Registry. It offered to restore the Registry from backup and try again, warning me that I might lose something in the process. There didn't seem to be much of an alternative, so I told it to go ahead.

I got the same message once more, and once more told it to go ahead. Recall that the first time I brought up the SCSI Zip drive, I did so with no cartridge in the drive. I had forgotten that, and there was a cartridge in the drive this time.

The system came up on the third try, and Lo!, the drives were really out of order. The D drive, which is merely a logical partition of a single physical drive, had been moved and the SCSI Zip drive had taken over D. E was still the Maxoptix T3-1300, F was now the D drive, and the CD-ROM drive that normally lives at F was now G. All those drives worked in the sense that I could access them, but any software that expected the D drive to be D was hosed.

Shut down once more. This time, it shut down with no problem, and I have been unable to duplicate the shutdown problem on any machine since that first time. I've no idea what happened. Anyway, I removed the cartridge from the SCSI Zip

ROSS SPARCplug™

Cross-Platform Technology: The Best of Both Worlds.

ROSS Technology announces SPARCplug, a high-performance workstation that fits into the full bay slot of a tower PC. SPARCplug offers better-than-SPARCstation™ 20 performance, with single or dual hyperSPARC processors, up to 256 MB RAM and a SBus slot for options like a T1 line, T3 Line, ISDN or 100-base T Ethernet.

ROSS is a leader in SPARC™ multiprocessing design and technology, so you know SPARCplug is fully compliant with SPARC-based hardware and supports all 10,000-plus SPARC applications.

Infinite possibilities. Ways to use SPARCplug are as varied as your needs. Some of the possibilities include:

- Intranet and Internet Server: SPARCplug lets you combine a stable and robust Unix server with a Windows™-based PC client, all in one unit. When combined with Netscape's FastTrack™ or SuiteSpot™ applications, SPARCplug can become the center of your client/server workgroup environment. SPARCplug comes bundled with your choice of SuiteSpot server applications, which can include Netscape Enterprise Server,™ Proxy Server™ and Mail Server.™ SPARCplug provides a true multi-tasking, multi-user environment for fast, easy and safe access to the net.
- Engineering Workstation: SPARCplug gives you powerful processing for engineering projects while also allowing you access to the PC enterprise working environment. It saves space and cost.

Call ROSS today at 1-800-774-ROSS to find out more about the amazing SPARCplug!

Circle 155 on Inquiry Card (RESELLERS: 156).

drive and fired up once more. It came up fine. The D drive was once again D.

Of course, the Zip drive had shoved the CD-ROM drive aside and taken over F in its usual high-handed fashion, but otherwise I had no problems. This time it shut down properly, and from that moment on, I have had no problems other than the displacement of the F CD-ROM drive.

The moral of this story is that SCSI has a mind of its own, and if you intend to use a SCSI Zip drive, plan your drive-lettering scheme accordingly. Do not imagine that you can have a CD-ROM drive with a lower drive letter than the SCSI Zip drive; and if you plan to boot up your system with a cartridge in the drive, be prepared for some other oddities in drive lettering.

You will, however, have a perfectly good drive. You can even boot from it, which means that you can have a series of OSes on different Zip cartridges and boot the one you like. I've tested it with Win 95 and Windows 3.11. I haven't yet tried it with Unix, Windows NT, or any flavor of OS/2, and I probably won't; but I'm told it will work just fine with those, too, since you can set up your computer to believe that the SCSI Zip drive is just another Winchester hard drive. Incidentally, that's also true of the Syquest EZ135.

One possible configuration is to have a hard drive as the data drive. Set it as a non-primary drive and then set a Zip drive as the C boot drive. Then you can boot any OS you like by changing cartridges.

Once I was sure the SCSI Zip drive worked on Pentafluge, I transferred it to Cyrus, my Cyrix 6x86-P166 system. Cyrix claims their P166 is completely compatible with, and faster than, a Pentium running at 190 MHz. I've used the Cyrix system for a couple of months now, and I have no reason to dispute that claim. It is fast, compatible, and reliable.

Cyrus has a PCI-bus Adaptec SCSI card with an external SCSI-2 connector port, so I moved the DRM-624X and SCSI Zip drive

You can have a series of OSes on different Zip cartridges and boot the one you like.

string over to it, and booted up with the DRM-624X turned off and no cartridge in the Zip drive. It came up fine. Cyrus does not have a Maxoptix optical drive, so the CD-ROM drive is E. As expected, the SCSI Zip drive displaced it, taking over the E slot for itself and moving the CD-ROM drive to F.

Unlike Pentafluge, Cyrus had a network drive mapped to F, but that didn't matter. The SCSI Zip drive became E, the CD-ROM drive became F, and the F network connection vanished. Actually, it didn't quite vanish. While I could read the CD-ROM drive as F, when I went into My Computer and looked at network drive connections, the pull-down menu still showed F as a network connection.

Shutdown was normal, and booting up with a cartridge in the Zip drive produced no different result from when there wasn't a cartridge. That is, while booting with a cartridge displaces the D partition on Pentafluge, it doesn't do that on Cyrus. No one I've spoken to can tell me why.

The next step was to connect both Zip drives to Cyrus. They worked fine, with the parallel drive taking the next empty drive letter (G), while the SCSI drive displaced the CD-ROM drive as usual. Finally, I turned on the DRM-624X, leaving both Zip drives attached to Cyrus. Everything worked. The SCSI Zip drive took over E; the internal CD-ROM drive became F; the

IF you develop **MULTIMEDIA** technology, you're sure to have the kinds of problems that only NSTL testing can help you solve.

Solutions that will help you to lower technical support costs, avoid unexpected incompatibilities and unfulfilled expectations and achieve and/or confirm higher levels of graphic and audio performance.

In other words, NSTL's independent testing helps you to repeal Murphy's Law.

So, if you want to improve your marketing, enhance your product designs, sharpen your competitive edge...and make sure your products do, in fact, live up to all your advertising claims... and all your customers' expectations ...come to NSTL.

REPEAL MURPHY'S LAW

THE LATEST METHODOLOGIES THE SAVVIEST ENGINEERS

Our state-of-the-art multimedia testing laboratory – one of 18 controlled-access labs – is dedicated to testing functionality, compatibility, performance, and usability across multiple platforms. In fact, no multimedia test suite is as comprehensive as ours. And our street-savvy testing engineers know how to find problems you never knew you had...before your customers find them.

CUSTOMIZED TESTING WITH PLUG-IN, PLUG-OUT EASE

We have Macs, all of the popular desktop PCs, multimedia notebooks, 2x to 8x internal and external CD-ROM drives, VESA and PCI video, SCSI, IDE and PCMCIA controllers, MPEG, and a Brobdingnagian library of CD-ROM titles.

So, we can test at any stage of product development on dozens of configurations with plug-in, plug-out ease. And world-class accuracy and reliability. Quickly. Hassle free.

That's because at NSTL everything is up and running. Ready to be configured to duplicate your environment and solve your problems. At a moment's notice.

"NSTL can test our [multimedia] programs on very short notice and with quick turnaround. And they've uncovered problems that we didn't catch after our own inhouse testing. Their understanding of multimedia technology and the end-user market have helped us deliver stronger bug-free programs." David Harmon, Manager of Technology and Development Support, Discovery Channel Multimedia.

Now it's your turn...

Build customer confidence. Sharpen your competitive edge. Let customers know that your products have passed rigorous, independent tests that verify their "as advertised" compatibility and functionality.

CALL 1-800-220-NSTL *to request our brochure or a proposal detailing the scope, pricing, and scheduling of confidential product testing services, and/or to arrange a tour of our laboratories.*

Do it right now and we'll send you a FREE copy of the PC Digest issue on multimedia notebooks. No risk. No obligation.

Circle 148 on Inquiry Card.

DRM-624X took over G, H, I, J, K, and L; and the parallel Zip drive took the lowest unused drive letter after L.

The interesting thing about this is that several of the drive letters between F and L had been mapped to other network drives. Those network connections simply vanished—except that their ghosts remained in the network setup, and booting up with the DRM-624X turned off restored them.

The bottom line here is that both parallel and SCSI Zip drives work quite well. They read each other's disks just fine. The parallel Zip drive installs simply and works unobtrusively, finding an unused drive letter for itself.

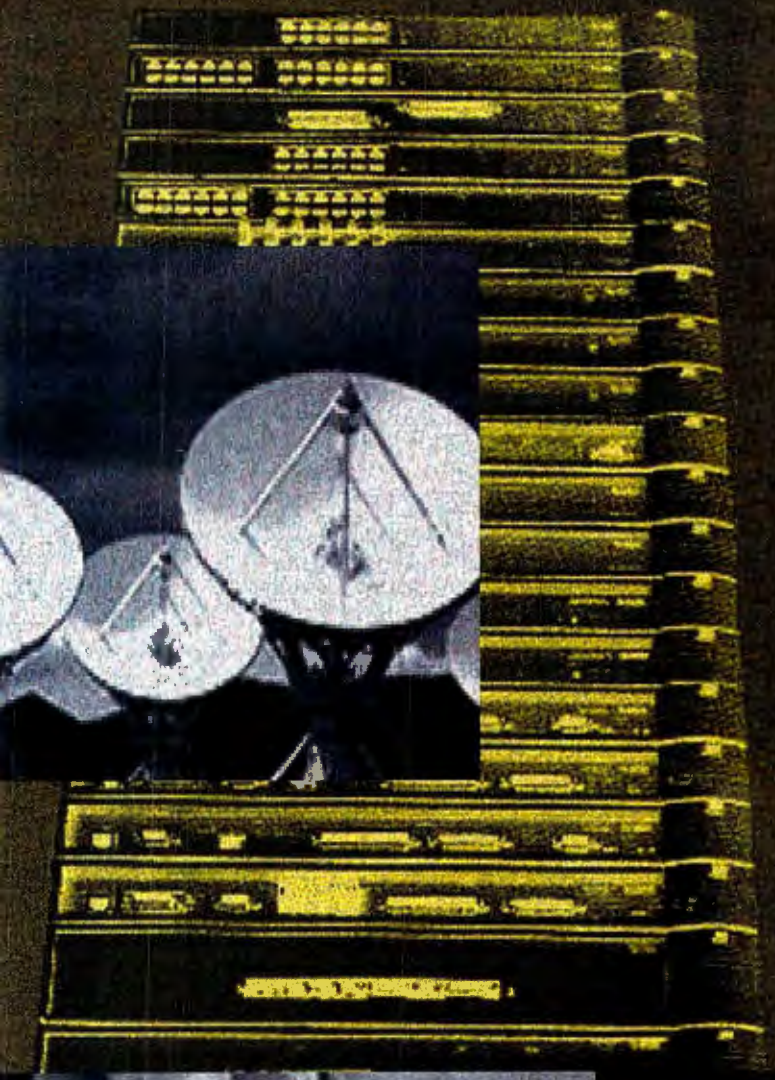
The SCSI Zip drive installs easily if you already have SCSI devices; otherwise, you will have to install a SCSI card and drivers. This isn't particularly difficult, but it's certainly harder than just connecting a cable to the printer port. The SCSI Zip drive is more aggressive and will certainly displace a CD-ROM drive if brought up with a cartridge in the drive, and it may even displace a hard disk partition. You are unlikely to prevent this no matter how hard you try. Otherwise, no damage is done.

The SCSI drive is about three times as fast as the parallel drive and perhaps half as fast as your average hard drive. Either can be a good way to add storage capacity to your system. I particularly like the parallel Zip drive as a backup-and-sneakernet system, but, of course, unlike the SCSI Zip drive, you can't use it with a Mac. The SCSI drive works well with both Macs and PCs. If you need storage space and a backup system, either is pretty hard to beat. Recommended.

Having said all that, I have to point out that I have for about a year had a Fujitsu DynaMO 230 magneto-optical (MO) system attached to a SCSI port on an ancient Cheetah 386. I've used it across an Ethernet, and it's about as fast as the SCSI Zip drive. It has always been reliable. Nothing in the Fujitsu literature mentions using this on a Mac, but SCSI is SCSI, and I'd be astonished if you couldn't connect the DynaMO 230 to a Mac. What you won't do is read the DynaMO cartridges on a parallel-port device. Still, the DynaMO 230 works. The drive and cartridges are smaller than the Iomega Zip drives and their cartridges, and each DynaMO cartridge holds a bit more than 200 MB compared to the Zip drive's 100 MB.

I had hoped that Merlin, the newest version of Warp, would be able to make use of the Doubleshot 133's dual processors.

We installed the beta version of NT 4.0 on the Doubleshot 133, which had previously been running NT 3.51. At one time, it ran OS/2, and I had hoped that Merlin, the newest version of Warp, would be able to make use of the Doubleshot 133's dual processors, but IBM didn't put that feature in Merlin. IBM is beta-testing SMP for Warp Server. For now, to run OS/2 with symmetric multiprocessing (SMP),



Interop Online.

It's how you keep up to speed in networking.

Need up to the minute networking information? You don't have to wait for the #1 show in networking anymore. Just speed right to the site — Interop Online, the year-round resource for the networking community. The latest industry news, reviews, expert editorial, technology breakthroughs, links to product information, and the most comprehensive buying tool available are all just a click away on Interop Online.

You can also register online, arrange your show and conference schedule, and create the ultimate NetWorld+Interop experience with the Interop Show & Conference Planner (sponsored by NOVELL).

Interop Online. It's the networking information you need... now.

[http://www.interop.com]

you are stuck with clunky OS/2 2.11. While I rather like OS/2 Warp Connect, and I think I like Merlin, I refuse to go back and relearn version 2.11.

Installation of NT 4.0 was really simple on the Doubleshot 133. I haven't yet tried installing it on a machine running Windows 3.1 or Win 95; I'm told that's a bit more difficult, but nothing excessive. One thing, though: be sure you know the IRQ and port address settings for all your hardware. Unlike Win 95, NT doesn't even try to be Plug and Play. On the other hand, it won't change your settings for you once you have them the way you like.

We haven't done a lot of work with NT 4.0, but what I've seen I like a lot. It's much more like Win 95 than 3.11. In fact, you can use NT 4.0 quite a while before you notice it isn't Win 95. It's also faster. Although few current applications have threaded code able to take advantage of the Doubleshot 133's dual processors, ordinary single-threaded jobs are still faster because NT 4.0 is able to trade off between processors, putting all the background stuff like network and disk operations, monitoring the uninterruptible power supply (UPS) status, etc., on one processor while the other runs your task.

In practice, it's not quite that simple. NT 4.0 has a utility that shows a graph of processor-use history. There are two such graphs for a dual-processor system, and it's interesting to watch how NT switches loads between processors as you load it down by networking to the server.

There was a time when OS/2 was a technically more elegant OS than NT, and OS/2 Server was about the best server software around. I don't think that is true any longer; IBM long ago lost the marketing edge and may now have lost the technical edge as well. NT 3.51 is very stable and makes for a good server system; while NT 4.0, even in the beta version, is fast, easy to use, simple to install, and looks like Windows to most of your network. Moreover, IBM is rapidly adapting its server software to run just fine on NT systems. If you have a large computer network system and the resources to manage it, you may have a need for OS/2; but NT 4.0 seems to be the NT for the rest of us. More when I know more, but my first impressions of NT 4.0 are very positive.

Meanwhile, the little Doubleshot 133 remains the quietest system in the house. It's very stable, and running NT 4.0, it may be the fastest networked system we have

IT'S AMAZING HOW MANY COMPUTING EXPERTS PRACTICALLY LIVE AT THIS ADDRESS.

With so many web sites popping up today, it's hard to know which ones Net the best results. Especially if you're an advertiser looking to reach key Information Technology prospects.

Fortunately, the answer is close at hand. It's called The BYTE Site, and more computing influencers worldwide call it "home" than just about any address on the Web.

The BYTE Site is the online version of BYTE magazine, the worldwide technical authority for computing experts. That means it's chockfull of insights and information about the IT market from products to applications to trends. On The BYTE Site, visitors can instantly access every BYTE article published since 1993 through the BYTE Archive. Read all about the newest products and technologies in our Virtual Press Room. Share viewpoints with BYTE editors worldwide by on-site Email. Even download industry standard CPU test suites from our BYTEMarks benchmark service.

With features like these, it's no wonder The BYTE Site logged nearly 150,000 visits this past January alone, and posted an overall repeat visit rate of 41%. Not surprisingly, it's become equally popular among advertisers. That's because The Byte Site offers such interactive marketing options as hot-linked AD-Action buttons to showcase product information, catalog listings and data sheets. Plus our Virtual Press Room where users can access the latest press releases from your company.

To learn more about The BYTE Site, call John Griffin, **VP/Publisher** at 603.924.2663. Or find him on The BYTE Site at http://www.byte.com. You'll discover reaching computing influencers worldwide is easy once you know where they live.

BYTE

A Division of The McGraw-Hill Companies

THE GLOBAL AUTHORITY FOR COMPUTING TECHNOLOGY.

here. Those dual processors really speed things up. Just now, it is the NT experimental machine, but once I'm sure NT is stable, I think I'll put the Micropolis external 4-GB drive on the Doubleshoot 133 and make it the main Chaos Manor server.

Visioneer's PaperPort Vx is a blooming little miracle.

This is a gadget about 4 inches tall, 3 inches deep, and a foot wide. It sits anywhere you like and connects to a serial port with a normal cable. Once installed, you activate it by feeding it a sheet of paper. It reads your papers, one sheet at a time, into image files, one file per sheet.

Installation was simple: I plugged the PaperPort Vx into the COM1 serial port, connected its power supply, and ran the installation program. The software seems to have scanned my system, because when it was done, the PaperPort "desktop" had icons for Microsoft Word and WinFax, as well as "printer," Exchange, Excel, WordPad, and Paint.

I fed in a printout of some e-mail I'd received on BIX. The PaperPort Vx pulled it through and quickly made an image file of the document. Then I dragged the image onto the WinFax icon and sent it to my fax machine downstairs. It came out quite readable, as good as any fax comes out on my old thermal fax machine.

Then I dragged the image onto the Microsoft Word icon. That automatically activated the OCR to produce a Word document. It made one mistake: the original said "pc." The OCR read that as "pe."

I've also fooled around with other stuff. There are a bunch of settings to get different qualities of OCR performance and image quality. It's all quite intuitive, and now I've got electronic versions of some newspaper articles I've been saving, meaning I can find them by electronic search now. I think I'll do a lot more of that.

I had one major glitch. Once when I fed in a sheet of paper, the electric fan blew it about as it emerged, and the program said the read had failed, although examination of the document image didn't show any problems. After that, though, the PaperPort Vx wouldn't feed paper at all, and the software kept telling me there was no PaperPort device on COM1. I even tried turning off the computer and bringing it back up, and still the Visioneer software insisted there was no PaperPort on COM1. Finally, I turned off the PaperPort itself by pulling its power cord. That worked: it processed the next sheet of paper I fed it just fine. Apparently that "reset" it.

Visioneer also makes a keyboard with a PaperPort built into it, called the PaperPort ix. It has a separate power supply, so presumably you can "reset" it the same as with the stand-alone version. I'm fairly picky about keyboards, so I haven't tried it yet, but I'll have one of the interns install it at his station. I'm sure it will work; my only question is whether I'd like the PaperPort ix as a keyboard. More another time.

Disk space keeps getting cheaper. You can put a lot of documents on a 100-MB Zip cartridge; and that's a lot of paper you don't have to keep around. My son Richard uses a PaperPort to keep his paper files small, and it sounds like a good habit to get into. I expect I'll be writing about this again.

You'll have noted that my primary e-mail address remains jerryp@bix.com. BIX began as the BYTE Information Exchange and was eventually sold by McGraw-Hill to Delphi, which was later bought by News Corp. Recently, a group of Delphi/BIX employees with some outside backing bought both BIX and Delphi

and are making a going concern of both.

BIX isn't for everyone. It's small, and the interface is text-based and command-line-driven. It looks old and clunky. The appeal of BIX is the information density. BIX never exploded the way the Internet did, and as a consequence, there are intelligent technical conversations and very little spam. When you ask a question on BIX, you get a reliable answer.

My usual access to BIX is through a shareware program called Galahad. This is a Windows/Win 95 program that goes out to BIX, logs on, downloads all my e-mail and all the message traffic in the conferences I belong to, and then logs off, letting me deal with everything off-line with reasonable text editors. It's one of the main reasons I stay with BIX.

The main problem with Galahad has been using it on multiple machines. Galahad keeps all kinds of reference files, archives, and databases, and transferring all that when I want to use a different machine is a major pain. Then, just today, on BIX, BYTE technical editor Russell Kay suggested the solution: put Galahad—program, logs, files, and all—on a Zip cartridge. Carry the Iomega parallel Zip drive in checked luggage—a good idea for a backup system since I do a lot of work on the road—and access BIX that way. When I get back home, I attach the Zip drive to the parallel port of the system I'm using.

I haven't tried this, but I will. I'll probably go even further: since I have five Internet accounts and three e-mail boxes, I'll put all that Internet stuff on a Zip cartridge. Working out a backup system shouldn't be too difficult. Yet one more use for the parallel Zip drive.

Meanwhile, BYTE readers weary of the bickering and nonsense in much of the Internet might think about BIX, where all conferences are moderated and most of the participants really do know what they're talking about.

Two vital books for computer pros: *The Hard Disk Data Base* and *The BIOS Companion*, both by Phil Croucher, and both exactly what their titles imply. If you work with odd computers, particularly older ones, these are invaluable: page after page of technical data, all in one place.

The game of the month is the Strategic Studies Group's The Complete Carriers at War. All the older Carriers at War games and construction tools, plus new scenarios, including the North Atlantic and Mediterranean. Suppose the Germans had gotten control of the entire French navy: could the British have beaten the combination? Plus the entire Pacific carrier war. Lots of realism and no arcade action.

The CD-ROM of the month is The 1996 Grolier Multimedia Encyclopedia. It's well balanced between details and brevity. Philip Jose Farmer defined a dullard as a person who can go to the encyclopedia, look up one item, read it, and close the book. It's fun to browse Grolier.

The book of the month is by Cicely Veronica Wedgwood, *The Thirty Years War* (Routledge). I thought I knew all I wanted to about the Defenestration of Prague, Friedrich the Winter King, Father Tilly, Cardinal Richelieu and Father Joseph "the gray eminence," and Wallenstein, but once I opened this wonderful book, I found a wealth of details more fascinating than any

novel. Part of Hitler's popularity came from his promise to upset the Peace of Westphalia that ended the Thirty Years War.

The computer book of the month is by Gary Frerking, Nathan Wallace, and Wayne Niddery, *Borland Delphi How-To* (The Waite Group). I've neglected Borland Delphi in my language discussions, and I shouldn't: it's a practical language every bit as useful as Visual Basic, and, being rooted in Pascal, it has a more logical structure. The book teaches through examples and includes a CD-ROM with hundreds of subroutines that are useful in themselves as well as worth studying.

A computer book I overlooked when it first came out is Susan A. Kitchens' *The KPT Bryce Book* (Addison-Wesley). Bryce is the landscape-generator software portion of the Kai's Power Tools series; Kai's Power Tools are one of the reasons Mac computers are so much fun. Kitchens starts with basics and explains how to build structures, from castles to planets, with examples, including the inevitable CD-ROM of routines and pictures. If you use a Mac, you'll like this.

As usual, I've written more than will appear in the magazine. You can find it on BYTE's Web site. You might also want to check out http://www.earthlink.net/discontinuity, where John C. Dvorak and I argue critical issues. B

DISCOVER NOVUS VISA MasterCard American Express

Credit card charges are not submitted until time of shipment. For your protection, we ship only to your credit card's verified billing address. Freight is calculated as the carrier's actual freight charge plus insurance and packaging material. The cost of insurance is 0.35% (0.0035) of the order total. Packaging materials will not exceed $4.00 for single package shipments or $6.00 for multi-package shipments. Before returning any product, you must obtain an RMA number. Non-defective returns are subject to a restocking fee. Software, chips and other electronic components are not returnable. Allow 10 business days for shipping when paying by personal check. All pricing subject to change. For all prices and products, CDW reserves the right to make adjustments due to changing market conditions, product discontinuation, manufacturer price changes or typographical errors in advertisements. All trademarks and registered trademarks are the sole property of their respective owners.

SMARTCACHE® IV
SMARTRAID® IV

We Wrote the Book On RAID.

Check Out Our Latest Editions

Communications Week called our SmartCache IV card with its optional RAID/Caching Module attached ***"...one of the fastest SCSI adapters we've ever tested."*** And our performance doesn't stop there. The new ***SmartRAID IV high performance ULTRA SCSI RAID adapters*** offer an **even faster** processor, and your choice of one, two or three SCSI bus configurations. Maybe that's why SmartRAID IV adapters have been chosen by major computer manufacturers around the world as the standard RAID offering in their high-end servers.

Key features of DPT RAID adapters include:

- Hardware RAID 0, 1 and 5
- Support for up to 64MB of cache
- Powerful on-board processors for best performance
- ***SmartCorrect***, DPT's exclusive error correcting technology
- Storage Manager software for easy RAID setup and maintenance

Call us today for more information on DPT RAID products. Mention the key code at the bottom of this ad and we'll also send you a copy of our latest book on RAID entitled **"RAID and SCSI Technology Papers."** See for yourself why we say: SmartCache, SmartRAID, Smart Choice!

Operating Your PC up to 300 Feet Away is a SNAP!

- **Locate your keyboard, monitor and PS/2 mouse up to 300 feet away from your computer**
- **Uses two Category 5 UTP cables for lower installation cost**
- **Works with PC, PC/XT, PC/AT, PS/2 and 100% compatibles**
- **Keep your PC in a secure, climate-controlled area and maintain access from crowded or harsh environments**
- **Supports up to 1024 x 768 non-interlaced resolution**

Diagnose any PC's problems fast with

the UNIVERSAL DIAGNOSTICS TOOLKIT™

- **Get the best, most accurate full-system diagnostics package for all your problem PCs.**
- **Low-Level Formats all hard drives including IDEs. Allows relocation of Track 0.**
- **Works with any PC regardless of O/S: DOS, Windows 95 & NT, O/S2, Unix, Novell, etc.**

Loop-back Plugs— 9-pin serial, 25-pin serial and 25-pin parallel plugs, used for external I/O port testing.

2 Micro-Scope floppy disks— containing the best PC diagnostic tools on the market. Comes with both 3.5" and 5.25" disks to work with any PC.

Complete Micro-Scope Manual— easy to follow testing procedures and detailed error code descriptions. See the features list at left to view some of the incredible wealth of testing capabilities this program contains.

Micro-Scope™ 6.1
UNIVERSAL DIAGNOSTIC SOFTWARE

Call for Your 6.15 Upgrade

Fully O/S Independent diagnostic software...

Call for upgrade pricing & complete new features list!

MICRO-SCOPE Universal Computer Diagnostics was developed to satisfy the expanding need for accurate system diagnosis in the rapidly growing desktop computer market. Patterned after super-mini and mainframe diagnostic routines, **MICRO-SCOPE** runs independently of any standard operating system, and is therefore at home on any machine in the Intel world. Speed, ease-of-use, and razor sharp **ACCURACY** are a few of the advantages that arise from this system independence. **Jerry Pournelle** awarded MICRO-SCOPE & POST-PROBE the User's Choice Award in the May 1994 issue of Byte Magazine, saying: **"You name it, this tests it. If you maintain PCs you'll love it."**

◆ **LOW-LEVEL FORMAT**—Performs low-level format on all hard drives including IDE drives. ◆ **TRUE HARDWARE DIAGNOSTICS**—Accurate testing of CPU, IRQ's, DMA's, memory, hard drives, floppy drives, video cards, etc. ◆ **RELOCATES TRACK 0** on hard drives that support relocation. ◆ **IRQ CHECK**—Talks directly to hardware and shows I/O address and IRQ of devices that respond. ◆ **O/S INDEPENDENT**—Does not rely on O/S for diagnostics. Talks to PC at hardware level. All tests are full function regardless of O/S (i.e. Windows, Novell, UNIX, O/S2). ◆ **IRQ DISPLAY**—Show bits enabled in IRQ chip for finding cards that are software driven (Network, Sound Card, etc.). ◆ **MEMORY DISPLAY**—Displays any physical bit of memory under 1 MB. Very useful for determining memory conflicts and available memory space. ◆ **AND MUCH MORE...**We don't have enough space here for everything this software can do!

PC won't boot up? Find out why fast with our universal POST card...

"This is the only card that will function in every system on the market. The documentation is extensive, and not only covers the expected POST Codes for different BIOS versions, but also includes a detailed reference to the bus signals monitored by the card." **—Scott Mueller** from his globally recognized book, ***'Upgrading & Repairing PCs, Second Edition'***

◆ Includes pads for voltmeter to attach for actual voltage testing under load. ◆ 4 LEDs monitor +5vdc -5vdc +12vdc -12vdc. ◆ Monitors Hi & Lo clock and OSC cycles to distinguish between clock chip or crystal failure. ◆ Monitors I/O Write and I/O Read to distinguish between write and read errors. ◆ Accurately monitors progress of POST for computers *without* POST codes. ◆ Reads POST codes from any IBM or compatible that emits POST codes. ISA/EISA/MCA. ◆ Compatible with Micro Channel computers. ◆ Dip switch allows easy selection of I/O ports to read. ◆ Includes **TRI-STATE LOGIC PROBE** to determine actual chip failures. ◆ Manual includes chip layouts and detailed POST procedures for all major BIOSs. ◆ **AND MUCH MORE...**call for more details.

Reliable and Affordable Ethernet Networking Products!

EtherPRO III Series

10BASE-T/BNC Adapter Card features Plug 'N Play I/O, interrupt and PROM address. NE2000/IEEE802.3 compliant with LED indicators for activity and link detection. Supports NOVELL, Microsoft, Artisoft, FTP and PC/NFS. Compatible with all Bus systems, 10Mbps transfer and is FCC certified.

Configuration options:

- Plug 'N Play Design -I/O 300h,320h,340h & 360h
- Interrupt 2,3,4,5,10,12,15

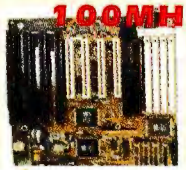
100MHz PENTIUM MOTHERBOARD



PREMIO PERSONAL • COMPUTERS

Supports Intel Pentium processors 75 to 166MHz. AMI Plug 'n Play Flash BIOS, clock generator for fast speed changes and meets EPA EnergyStar Standards.

- -256kB cache
- -Four 72-pin SIMM sockets support EDO with up to 128Mb.
- -Built-In Controller support 4 IDE drives (up to 16.6MBps transfer)
- -Features 4 PCI Master & 4 ISA Slots
- -Integrated I/O features EPP/ECP bi-direcotional parallel port, Two 16550 UART Serial ports with 16 byte FIFO, LBA IDE drive support over 528Mb

RAID PERFORMANCE

DATA INTEGRITY

Today's applications require higher performance and reliability from your storage configurations. Consan RAID systems are your storage solutions.

We have specialized in mass storage configurations for nine years and Consan designs the highest performing RAID configurations to meet your most demanding needs.

- HARDWARE+SOFTWARE RAIDS — All Raid levels for all platforms.
- HOT SWAP — Optional hot swap drives, power supplies, and fan.
- DIGITAL VIDEO+CAD — Digital Video + CAD Approved with most applications.
- NETWORK SERVERS — Combining performance and data integrity.

CONSAN builds Seagate based solutions as well as a full line of other disk, tape, optical and CDR storage products. For more information, call Consan toll-free at :

1-800-221-6732.

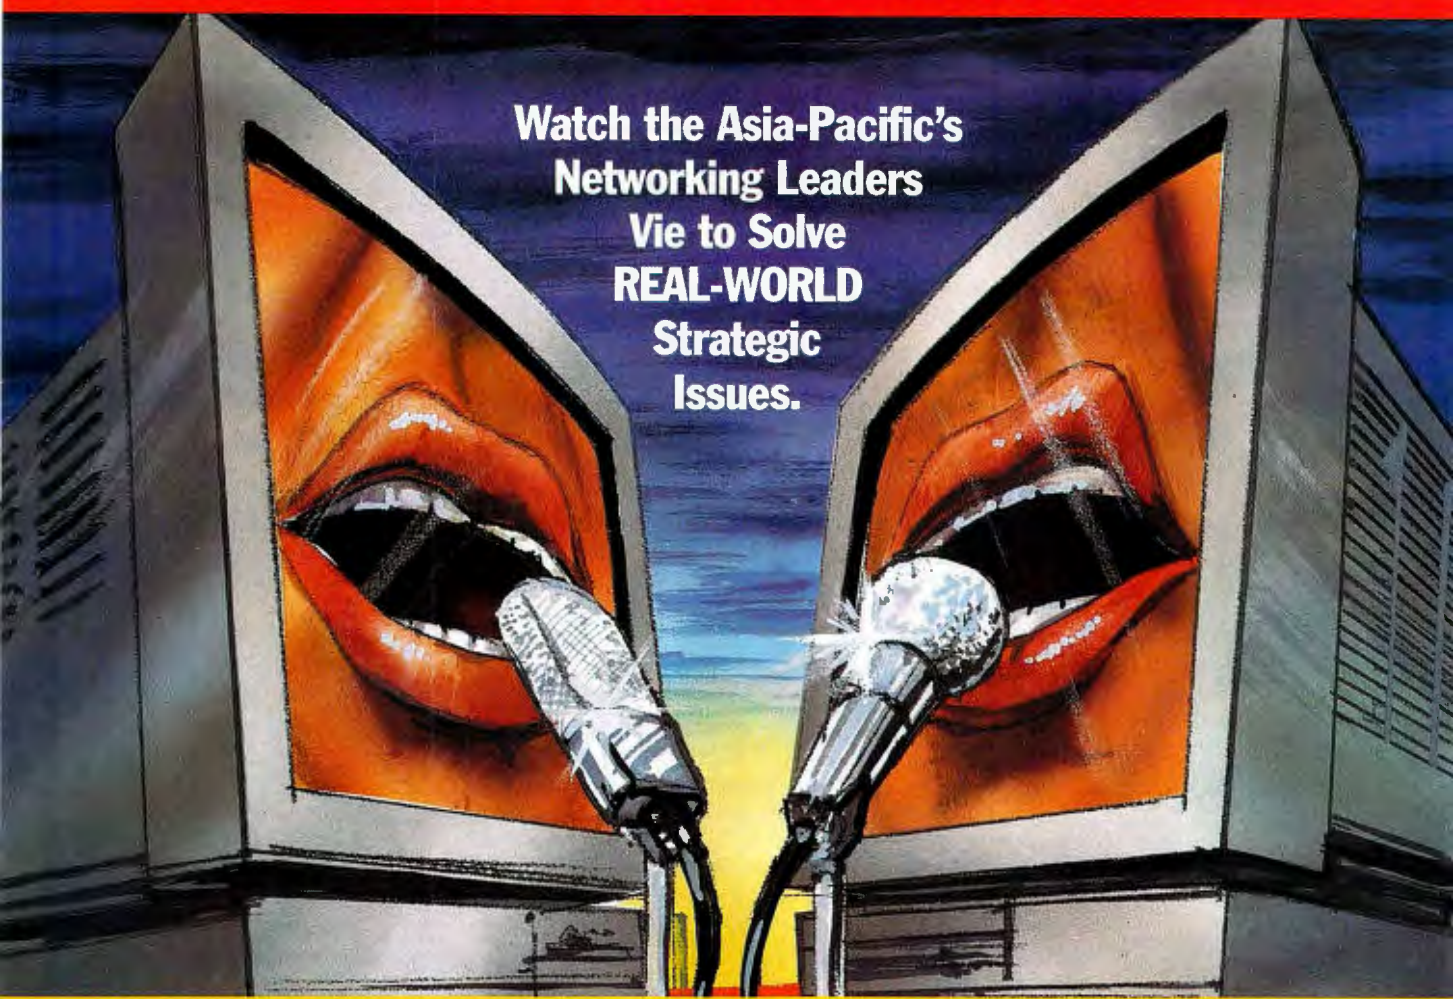
Data Communications ASIA-PACIFIC

THE GREAT DEBATES ON LAN AND WAN STRATEGIES

DATAPRO Information Services Group



SINGAPORE OCT. 24th • HONG KONG OCT. 29th • SYDNEY OCT. 31s

Two real networks, two real debates on how they should grow.

Here's a common-sense, real-world seminar to help you practically understand the new high-speed LAN, switching, and routing technologies, as well as frame relay, ATM and the new wide-area networking products and strategies.

First you'll get a tutorial on these hot areas from Robin Layland, Data Communications Contributing Editor and experienced networking manager, and Datapro analyst Mitch Radomir, an Asia-Pac expert in internetworking.

Then, you'll be able to compare the products and strategies of the leading Asia-Pacific networking vendors and then watch them solve two real-world networking problems facing a typical campus network and wide area network in the region.

Here's only some of the issues to be addressed:

- How will campus networks evolve over the next three years?
- Will routers be replaced by switches?
- How much bandwidth is needed on the desktop?
- What's the best way to handle voice and data to remote locations?
- Is ATM the answer?
- Is it frame relay that handles both data and voice?
- What role should the internet play?

NEWBRIDGE · CABLETRON SYSTEMS The Complete Networking Solution™ · ascom Timeplex

More to follow:

Register now! Fax to +65-538-4436.

Seating is limited to 200 attendees, For more information call Rosie Lee at:

Copy Protection

Why use more and more developers WIBU-KEY to protect their software against piracy?

- ✔ **Longevity:** You could use a WIBU-BOX from 1989 today with Windows NT, which does not exist 1989! Also you could run old software for DOS today in a DOS box of Window NT or 95. Each WIBU-BOX is accompanied by a full 3 year warranty.
- ✔ **The most flexible security system for the programmer:** Great Windows interface for programming of WIBU-BOXes and protection of applications, automatic detection of all WIBU-BOX variants with one software. WIBU™-BOX for **LPT, COM and ADB**, transparent and cascadable, as **PCCard** and **(E)ISA card**. No special, expensive network dongle, the same WIBU-BOX for single stations and usage for a network server. It's one API for **DOS, Windows 3.x, 95, NT OS/2, MacOS** and **networks**, independent of the programming language.
- ✔ **The most user-friendly security system for the developer's customer:** The WIBU-BOX is one of the smallest dongles available with an unique design and handling advantage for your customer. A great control panel applet provides easy installation and diagnose tools to your customer. New sales or updates could be handled by "Remote Programming" the WIBU-BOX at your customers PC.
- ✔ **The most secure system:** WIBU-KEY doesn't just do a quick check to see if the dongle is connected – it works by encrypting through our custom ASIC. With top notch security and flexibility. Each encryption in the WIBU-BOX is initialized by a FEAL-8 algorithm (block chiffre, 64 bit key). Over 200 different encryptions could be enabled independently with one WIBU-BOX for selling different applications separately. Additional, each encryption has over 4 billion variants, choosen by a 32 bit selection code.

WIBU-KEY on stage at these next events:

BECOME A CNE ...FAST!

THE FIRST CNE COMPUTER BASED TRAINING PROGRAM IS HERE...

The AllMicro CNE Self-Study Course™ is the first 100% Computer Based Training (CBT) program to fully prepare you for Novell's CNE exams. Its innovative design provides fast, effective and convenient training to anyone wishing to become a Certified NetWare Engineer, even when hampered by a busy schedule. Our CNE CBT allows you to learn and practice *everything* you'll need for full NetWare certification.

- All on one CD
- Interactive NetWare simulation for hands-on exercises
- Study at your own pace
- Hundreds of practice questions
- Priced below competitive products
- Everything you need to prepare for Novell's test!

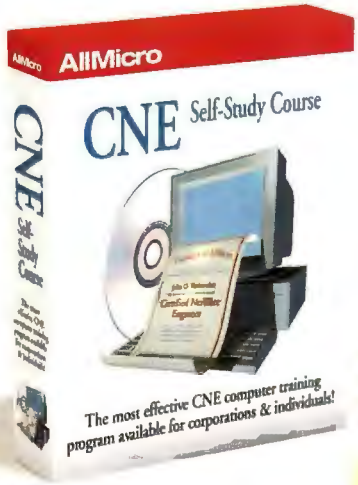
Effective!

Through the use of interactive exercises, you'll be able to gain practical hands-on knowledge under simulated situations without the need for a working network.

AllMicro's CNE CBT ensures that when you complete your training you'll be fully prepared to pass your CNE exams, and best of all, you'll be ready and confident to go into the workplace and perform vital CNE functions.

Convenient!

Our CNE CBT program offers you flexibility and portability unmatched by traditional training methods. You will study when and where it's convenient, at your own pace using a step-by-step format for either NetWare 3.1x or 4.1!



Affordable!

The AllMicro CNE Self-Study Course is priced far below other competitive training packages, so you can now get top quality training at a price you can easily afford.

Added Bonus!

The AllMicro CNE Self-Study Course even comes with the required Micro House Technical Library™. You'll have at your fingertips the latest specifications, diagrams, hardware settings, component locations, configurations, and other hardware technical information, all on CD-ROM. Familiarity with the Technical Library is required for full certification.

Don't put your career on hold any longer! Get the AllMicro CNE Self-Study Course and get certified...FAST!

COURSE MODULES INCLUDE:

- Administration v3.1x
- Advanced Administration v3.1x
- 3.1x Installation & Configuration (#802)
- Service & Support for NetWare (#801)
- TCP/IPTransport for NetWare
- Networking Technologies
- NetWare 3.1x to 4.1 Update

**NetWare 4.1 course also available*

NOTE: *As of 6/30/96 current CNE's will lose their certification unless they pass Novell's new 3.1x-4.1 update test. We have the course!*

Add Four Comm Ports To Your Laptop

With One Small Card

An expanding new world of communication for laptop and portable computing can be found through a new and innovative PC-card from Quatech. The QSP-100 has four RS-232 asynchronous communiciation channels accessed via four separate D-9 connectors.

Ideal for multi-tasking environments, the QSP-100 is powered by 16550 UARTs allowing for a maximum baud rate of 120K. In order to minimize resources while communicating to multiple devices the QSP-100 requires only one hardware interrupt. For information on this card and other innovative PC-card products please call 800/553-1170 for a free catalog.

We make software protection easier to handle.

Software Security's new UniKey® technology could change the way you think about software protection forever.

Even though our new hardware keys are small, they still offer the most powerful and reliable barrier against software piracy ever developed.

And with competitive pricing, they won't squeeze your margins either.

- Secure protection for multiple applications/versions
- The industry's only patented protection technology
- Protects applications quickly, without programming
- Remote update capabilities
- DOS/Windows/95/NT/Unix/NetWare support
- Time/date-based execution control
- Made in U.S.A.

UniKey makes software protection easier on your customers, your developers, and your budget... but harder than ever on pirates.

Call **1-800-841-1316** for more information, or to order our Developer's Kit, with everything you need to try UniKey protection on your application.

THE BUYER'S MART

THE BUYER'S MART is a unique classified section organized by product category to help readers locate suppliers. Each ad has Inquiry numbers to aid readers requesting information from advertisers.
AD FORMAT: Each ad will be designed and typeset by BYTE. Do NOT send logos or camera-ready artwork. Advertisers should furnish typewritten copy. **2"x1 1/16"** ad can include headline (23 characters maximum), descriptive text (300 characters is the maximum recommended) plus company name, address, telephone and fax number. **2"x2 5/8"** ad has more space for descriptive text (850 characters is the maximum recommended).
DEADLINE: Ad copy is due approximately 2 months prior to issue date. For example: November issue closes on September 8. Send your copy and payment to: THE BUYER'S MART, BYTE Magazine, 1 Phoenix Mill Lane, Peterborough, NH 03458. For more information please call Vivian Bernier in BYTE sales at 603-924-2521 or FAX: 603-924-2683.

RATES (Jan. 1996)

E-Mail Meets Personal Information Management

There's good news for those of you who spend a good portion of your day creating and responding to e-mail: Microsoft's Outlook 97 integrates e-mail with common business applications such as scheduling, PIMs, and word processing. Slated to ship by the end of the year, Outlook 97 lets you juggle tasks such as scheduling, basic contact management, and task delegation in one place, under one consistent interface (see the screen above).

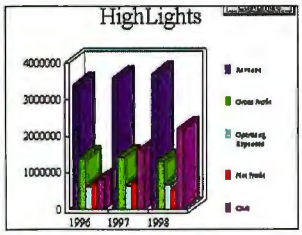
Outlook 97 offers an immense number of new features. The primary benefit is that unlike Schedule+ (which this new program replaces), Outlook 97 provides a single store for e-mail and other information. For example, you can create an appointment in Outlook 97's calendar module by simply dragging an e-mail message into the calendar. Another timesaving feature, auto-preview, helps you prioritize e-mail reading by displaying only the first few lines of a message. Remote users can download just the header and subject of a message before downloading all its contents.

Outlook 97 includes several form templates to let you automate expense reports, vacation requests, and other activities; you can also create forms. The intuitive rules-creation module, slated to ship shortly after Outlook 97, lets you automate message responses. Based on my experience with Outlook 97, it is a fine implementation of the next step in the evolution of e-mail. **–Dave Andrews**

Business

Enterprise-Wide Business Planning

TWO INTEGRATED PRODUCTS FOR WINDOWS help you manage and control



groups, departments, divisions, and entire companies. Business Maestro ($995; Enterprise model, $3995) provides tools for formal business and strategic planning, financial modeling and control, and managing the budget process. Business Maestro has data import and export facilities supporting a number of popular formats. Designed for cost centers, Budget Maestro ($495; Enterprise model, $1995) assists companies in bottom-up and top-down budgeting, and you can use it with Business Maestro.

Client/Server Project-Collaboration Tool

A CLIENT/SERVER APPLICATION THAT SUPports TCP/IP- and NetWare-based IPX/SPX networking, TeamWay (per server, $1000; per client, $350)

	Resource	Task Name
2	Cindy	Web Browser Prototype
3	TW 2.0	Save window settings
4	David	Mulitple select
5	TW 2.0	Color select
6	TW 2.0	Admin
7	John	Archive
8	John	Set Permissions

delivers timely status information to individual team members and their managers. The product helps team members track personal responsibilities across projects, as well as manage nonproject obligations. The program schedules a project's component tasks based on each team member's constraints and updates everyone as changes occur in the project.
Contact: Island Way Corp., Wellesley, MA, (617) 235-6740; http://www.islandway.com.
Circle 1016 on Inquiry Card.

This month, we preview Microsoft's Outlook 97, which replaces Schedule+, and Matrox Graphics' 64-bit Mystique PCI graphics board.

Build Business Models

A STAND-ALONE WINDOWS APPLICATION for creative business thinking, Advance 1.0 ($695) helps you build business models and analyze multidimensional business data contained in corporate databases.

Networking

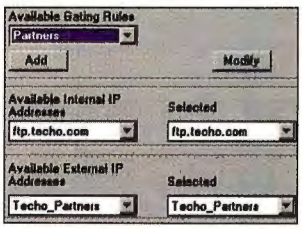
Windows 95 Backup Software

SMARTSTOR'S ($65) INSTALLABLE FILE System feature uses a 32-bit VxD to establish a tape drive as a logical, mounted storage device, making it easier to view, back up, and restore data. Once you mount the system, you can access the tape drive just as you would any other on-line storage device. SmartStor also lets you back up data to hard drives and optical drives anywhere on the network.

Contact: McAfee, Santa Clara, CA, (408) 988-3832; http://www.mcafee.com.
Circle 1022 on Inquiry Card.

Internet Firewall Security

DESIGNED TO PROVIDE COMPUTER NETWORK security for medium- to large-size organizations with Internet or intranet exposure, On Guard screens IP and IPX packets and rapidly compares the "state" of each packet against the firewall's rules base. If the traffic is not permissible or is unexpected, such as a hacker's attempt to spoof the firewall, On Guard drops the packets and issues an alert to the On Guard Manager workstation.



Contact: On Technology Corp., Cambridge, MA, (800) 767-6683 or (617) 374-1400; http://www.on.com.

WHO DO YOU TRUST WITH THE TRANSMISSION
in your Teutonic sports coupe?
An expert mechanic or Ed from the corner Gulf station.
Your gall bladder?
A surgeon or some guy fresh from medical school.
Hmm. Tough choice.

Now imagine you're a business trying to cope in today's "ever-so-wired" world. Sure, you know the problems and opportunities. But which IT products offer the best solutions is Greek to you.

Once again, an expert is called for.

So you get him in your office (he works for you, after all) and say, "Hey, this convergence of computing and communications thing is driving me nuts. You're the technology expert, find me some answers."

And he comes back a month or so later with all the right solutions and products. And you say, "How did you do that so fast?"

And the expert says, "BYTE."

And you wonder how much he knows about transmissions.

▽

Nearly one million computing experts worldwide read BYTE magazine every month. Because only BYTE delivers the global coverage and technical insights that illuminate Information Technology from problem through solution. That makes us something of an authority on the subject. And you something of a genius when you advertise in BYTE. For more information, call John Griffin, VP/Publisher at 603.924.2663. Or contact us at http://www.byte.com

THE GLOBAL AUTHORITY FOR COMPUTING TECHNOLOGY.

desktop systems in CAD/CAM and multimedia applications. Compatible with Intel Pentium and Cyrix CPUs, the P55TU ($479) can support system speeds of up to 200 MHz and features Intel's 430HX chip set and the Adaptec Ultra Wide SCSI controller. The P55TU is also SCSI RAID bus slot-ready, so you can add RAID functionality to your system, supporting RAID levels 0, 1, and 5. The P55TV ($369) and P55TVS ($399) provide most of the same features as the P55TU, but, instead, they are equipped with the Intel 430VX chip set and an Ultra SCSI controller.

Champagne Graphics at Beer Prices

PC graphics are entering a new era. For the price of almost any of yesterday's vanilla PCI graphics boards, today you can get swift 2-D graphics, impressive 3-D effects, and smooth video.

Engineers, stay calm. The Mystique won't fit the bill for a lot of CAD-type work, since it stops at a resolution of 1280 by 1024 pixels. Similarly, if you're a graphic artist who needs 3-D graphics with 32-bit color at the highest resolutions, look elsewhere.

However, more mainstream computer users will benefit from this 64-bit board's MGA-1064SG processor and fast memory. MPEG software decoding performance is very smooth. I ran the Mystique, with late beta drivers, through NSTL's Imark video suite, and it dropped no frames in any of the video tests. As for 3-D, whether the application is a game, training, or a simulation, results will be impressive. A peek at upcoming games based on Microsoft's Direct3D reveals that features such as perspective-correct texture mapping and shading add a great deal of realism to animated scenes.

While beta drivers prevented me from making accurate comparisons with Matrox's older MGA Millennium line, I expect the Mystique to outperform it and most other midpriced graphics boards (including some 128-bit ones) with previous-generation chips.

–Mark Schlack

Networking

Wireless Infrared Token Ring Adapter

NOW, YOU CAN CONNECT YOUR PORTABLE PC to Token Ring networks using JetEye Net Plus ($719). The adapter supports IrDA data transfer standards of up to 4 Mbps; supports IPX, TCP/IP, and NetBEUI; and allows you to roam between Token Ring and Ethernet networks without reconfiguring your portable.

Beyond the Bouncing Heads

Use JFactory to quickly assemble Java applications.

By Rick Grehan

The quantity of new Java products that arrives daily at BYTE is unnerving. The number of new Java books alone is such that I'm pretty sure the delivery people will soon be unloading them with snow shovels.

Consequently, the Java signal-to-noise ratio is very low; the job of sifting wheat from chaff is difficult. Many of us are still working through the source code for the bouncing-heads demo. There's nothing wrong with that; I'm guilty of it myself. You have to start somewhere.

But once you've got those heads figured out, you should turn your attention to a pair of seriously good Java program jump-starters from Rogue Wave Software. A purveyor of C++ class libraries, Rogue Wave now also offers JFactory, a user-interface development environment for Java. (At the time of this writing, a beta version of JFactory with a 30-day usage limit was available for downloading from http://www.roguewave.com. Be warned, however; the file is over 3 MB.)

JFactory looks with longing eyes toward Visual Basic (VB). The act of creating an application (or applet) within JFactory proceeds along the same lines as building a VB program. You start out guided by what amounts to a wizard, which builds for you an empty window (or form, or frame, whichever term you feel comfortable using). A tool palette appears, and, by selecting items from that palette, you populate the window with scroll bars, text boxes, buttons, and other elements. When you click on a visual object, the object-manager window opens, revealing that object's associated properties and events. Sound familiar? If you're a VB programmer, it should.

All the while, JFactory is conjuring source code, waiting for you to pick the Generate menu selection so that it can pour that source into a file for you. And in the resourceless world of Java, the amount of source code that must be produced (and ultimately executed) to create those visual objects will amaze you. Hence, JFactory does you a big favor.

Iterative development is particularly important in user-interface design. You want to be able to add a toolbar and see immediately what it looks like in the final application or be able to associate a series of buttons with the opening of various dialog boxes and quickly confirm that each button leads to the intended dialog box. JFactory permits code-and-test work with its Test Interface capability. Once you've got a rudimentary user interface clicked-and-dragged together, you then select Test Interface from the Project menu, and JFactory simulates the action of the interface.

This simulation goes quite far. For example, JFactory's image-loop visual object accepts as properties the path name to a starting GIF file and the number of images in the loop. If the first GIF file's name is PICT1.GIF, and if the number of images selected is four, then the image-loop object knows to load the series of files PICT1.GIF, PICT2.GIF, PICT3.GIF, and PICT4.GIF. Once the image-loop object is instantiated and added as a member of a window's or dialog box's components, it immediately begins playing those images as frames in a moving picture. JFactory's Test Interface selection provides full image-loop automation.

WHERE TO FIND

Rogue Wave Software
(541) 754-3010
http://www.roguewave.com

Ironically, the simulation of an image loop goes faster than the actual execution of that same loop in Java. And thus another little dark cloud forms over the Java-performance landscape.

Also available from Rogue Wave is a suite of three Java packages: Jtools, Jwidgets, and Jmoney. Collectively, these packages are called JLibraries. (A subset of Jwidgets is included with JFactory.) Jtools is a collection of well-reasoned interfaces and classes. These include container classes for objects such as binary trees, B-trees, bags, collections, and the like. It also includes a regular-expression-handling class, as well as a set of classes that format text and numerics for output. (The latter is a real blessing if you have grown weary of coping with the paucity of `System.out.println()`.)

JFactory is available for Windows NT and 95. Both JFactory and Jtools need at least the version 1.0.2 release of the Java developer's kit (available from http://www.javasoft.com). JLibraries and a single-user license for JFactory each cost $195. The individual packages within JLibraries cost $99 each. Rogue Wave also provides annual support and upgrade contracts, as well as site licenses. B

VISIO EXPRESS 4.0

HOW TO SUCCEED IN BUSINESS WITHOUT BUYING SOFTWARE.

Besides its formidable 200MHz Pentium processor, this Dell Dimension comes with a powerful package of business software** pre-loaded. Not games. Not fluff. Serious stuff like Microsoft Office for Windows 95. The 32-bit virus protection of Norton AntiVirus. The powerful file management features of Norton Navigator. The data protection and recovery tools of Norton Utilities. And the many diagraming tools of Visio Express 4.0. Of course, it also comes with built-in Dell reliability, built-in Dell value, and our guaranteed next-business-day on-site△ service. So pick up the phone and order today. It may be the fastest way to get ahead in business yet.
