WE FIGURED OUT HOW AND WE RADICALLY R

We figured out a few months back that the best thing we could do to improve our products was to simply make more of them and get them out faster. Hey, it only makes sense. If you're in the market to buy the fastest computers on the planet, then  you're probably not a person who likes to wait. So we switched our manufacturing and shipping departments into high gear.

Now when you order one of these systems, it's on its way quickly. Also, you can add a peripheral,  memory upgrade, video card, or modem built-in because Power Computing (as always) offers custom-configuration.

It means you'll get exactly what you want and you'll get it fast.

The best part of custom-configuration is that you don't have to

TO SHIP THEM FASTER REDUCED OUR PRICES.

go searching around through multiple vendors or waste your precious vacation time installing something like a video card or an internal Jaz drive. You simply take your new Power Computing system out of the box, plug it in and turn it on. We do all the work for you.

**Not only has Power Computing made custom-configuration our trademark,
but our machines represent the most upgradeable Mac OS™ systems on the market.**

Because of our superior upgrade path, we're confident your new Power Computing

machine will last for years to come.

If you've been waiting to

move up to a new PowerBase™,

PowerCenter™ or PowerTower Pro™,

now is the time to buy from Power

Computing. **The wait is over.**

PowerComputing

POWERTOWER PRO: THE FASTEST, MOST EXPANDABLE MAC OS SYSTEM

PowerTower Pro 225e 225MHz PowerPC 604e Processor

- 32 MB RAM (1 GB Max)
- 2 GB 7200 RPM AV Capable Hard Drive
- 8X CD-ROM Drive
- 1 MB Level 2 Cache
- IMS Twin Turbo 128M graphics accelerator with 8MB VRAM
- 6 PCI Expansion Slots
- Interleaved Memory
- 9 Drive Bays
- Dual (Fast 10 MB/Sec) SCSI
- Connectix Speed Doubler
- Extended Keyboard and Mouse
- Add Sony 20" Trinitron 20sfl1 S1795

\$4295 **NEW LOW PRICE**

PowerTower Pro 225e Core Config 225MHz PowerPC 604e Processor

- 16 MB RAM (1 GB Max)
- 2 GB 5400 RPM Hard Drive
- 8X CD-ROM Drive
- 1 MB Level 2 Cache
- 64-bit graphics accelerator w/ 2MB VRAM
- 6 PCI Expansion Slots
- Interleaved Memory
- 9 Drive Bays
- Dual (Fast 10 MB/Sec) SCSI
- Extended Keyboard and Mouse
- Add Power 17" Display (vis. 15.7) for '695
- Add MiroMotion JPEG Video I/O Card for '495

\$3795 **NEW LOW PRICE**

PowerTower Pro 200e Core Config 200MHz PowerPC 604e Processor

- 16 MB RAM (1 GB Max)
- 2 GB 5400 RPM Hard Drive
- 8X CD-ROM Drive
- 1 MB Level 2 Cache
- 64-bit graphics accelerator w/ 2MB VRAM
- 6 PCI Expansion Slots
- Interleaved Memory
- 9 Drive Bays
- Dual (Fast 10 MB/Sec) SCSI
- Extended Keyboard and Mouse
- Add Power 17" Display (vis. 15.7) for '695
- Add MiroMotion JPEG Video I/O Card for '495

\$3295 **NEW LOW PRICE**

POWERCENTER: THE MOST AFFORDABLE 604s YOU CAN BUY

PowerCenter 180 Starter 180 MHz PowerPC 604 Processor

- 16 MB RAM (512 MB Max)
- 2 GB 5400 Hard Drive
- 8x CD-ROM Drive
- 512K Level 2 Cache
- 1 MB VRAM On-Board (4 MB Max)
- 3 PCI Expansion Slots
- Extended Keyboard and Mouse
- Mini-Tower Enclosure
- Add Iomega Zip 100MB Drive for '145
- Add Power 17" Display (vis. 15.7) for '695
- Add MiroMotion JPEG Video Card for '495

\$2795

PowerCenter 166 Starter 166 MHz PowerPC 604 Processor

- 16 MB RAM (512 MB Max)
- 2 GB 5400 Hard Drive
- 8x CD-ROM Drive
- 512K Level 2 Cache
- 1 MB VRAM On-Board (4 MB Max)
- 3 PCI Expansion Slots
- Extended Keyboard and Mouse
- Mini-Tower Enclosure
- Add Iomega Zip 100MB Drive for '145
- Add Power 17" Display (vis. 15.7) for '695
- Add MiroMotion JPEG Video Card for '495

\$2395

PowerCenter 150 Starter 150 MHz PowerPC 604 Processor

- 16 MB RAM (512 MB Max)
- 1 GB Hard Drive
- 8x CD-ROM Drive
- 512K Level 2 Cache
- 1 MB VRAM On-Board (4 MB Max)
- 3 PCI Expansion Slots
- Extended Keyboard and Mouse
- Low-Profile Enclosure
- For Mini-Tower Enclosure Add '100
- Add Labtec Speakers Starting At '29
- Add 28.8 Modem & Internet Kit '129

\$2095

POWERBASE: THE ULTIMATE ENTRY LEVEL SYSTEM

PowerBase 240 Starter 240 MHz PowerPC 603e Processor

- 16 MB RAM (160 MB Max)
- 1.2 GB EIDE Hard Drive
- 8x CD-ROM Drive
- 256K Level 2 Cache
- 3D Graphics Acceleration
- 2 MB DRAM based video (4 MB Max)
- 3 PCI Expansion Slots
- Extended Keyboard and Mouse
- Low Profile Enclosure
- For mini-tower enclosure add '100
- Add Power 17" (vis. 15.7) Display for '695

\$2195

PowerBase 200 Starter 200 MHz PowerPC 603e Processor

- 16 MB RAM (160 MB Max)
- 1.2 GB EIDE Hard Drive
- 8x CD-ROM Drive
- 256K Level 2 Cache
- 3D Graphics Acceleration
- 2 MB DRAM based video (4 MB Max)
- 3 PCI Expansion Slots
- Extended Keyboard and Mouse
- Low Profile Enclosure
- For mini-tower enclosure add '100
- Add 28.8 Modem & Internet Kit '129

\$1795

PowerBase 180 Starter 180 MHz PowerPC 603e Processor

- 16 MB RAM (160 MB Max)
- 1.2 GB EIDE Hard Drive
- 8x CD-ROM Drive
- 256K Level 2 Cache

Now Software brings you the #1 best-selling schedule and contact manager for the Macintosh. It's perfect for individuals, workgroups and the web. Fast and easy: one-click access to your schedule and contacts, plus easy setup for group scheduling and sharing calendars and contacts.

Stencil It! from Kaetron Software is packed with powerful tools and images (called stencils) that work together to automate the creation of flowcharts, network diagrams, web pages, floor plans, technical drawings, timelines and more. Instantly turn your creation into a hyperlinked web page.

Get the office suite that works hard for your small business. Now, with essential small business tools and the Bookshelf CD-ROM reference library, Microsoft Office 4.2.1 makes it easy to portray a professional image, work seamlessly with other organizations and increase productivity.

Automate sales, focus marketing, control inventory and simplify accounting—run your whole company with just one program! Sound too good to be true? See for yourself. Get Big BusinessSM FREE! Just visit <http://www.bigsoftware.com.applefree>. From Big Software.

For all you

Over 30 new shortcuts and improvements make Quicken Deluxe for '97 the fastest, easiest Quicken ever. Improved registers, reports, graphs, free mutual fund quotes and a new, streamlined interface designed for Mac users speed up daily tasks. Get Clickin' with Quicken. From Intuit.

Get two computers in one! With SoftWindowsSM 3.0 from Insignia Solutions you can run Windows and DOS applications on your Power MacSM, right alongside your Mac OS programs. It's 35% faster than version 2.0 and offers Sound BlasterSM compatibility for Windows applications.

In the past, you practically had to be a programmer to create pages for the World Wide Web. But now, whether you're a small business or home user, manager or webmaster, with Adobe PageMillSM software for the Mac, you can create professional, dynamic and colorful pages—quickly and easily.

Increase your productivity and achieve greater personal and professional success with ASCEND 4.0 from Franklin Quest. Its unique features help you plan your entire day, week or month. Schedule repeating tasks and recurring appointments and print onto Franklin Day PlannerSM pages.

MYOB is designed to help you do exactly that—Mind Your Own Business. With 100 business templates, a powerful report customizer, comprehensive payroll, instant cash-flow analysis and more, it's the perfect solution to help manage your business effortlessly. From Best!Ware.

Spell CatcherSM will become your constant writing companion. It enhances your vocabulary, checks your spelling as you write, saves you time and keystrokes with a customizable shorthand glossary and saves your work automatically. Your masterpiece is in good hands now. From Casady & Greene.

You'd swear that ruthless competitor is a 100,000 person operation blanketing the globe. Yet it could easily be someone just like you, a group of brave entrepreneurs making a go of it. Except, perhaps, for one very important fact. They have an edge. They're doing business on a MacintoshSM computer—where the

DRAW

like no other CAD

"This drawing—5 hours—
from start to finish."
—Allan Ommerli,
Interior Designer

You want drawings that look like the ones you've always done by hand—or better. Exquisitely detailed. Perfect arrows. Crisp lines. Or maybe a squiggly sketch. You don't want it to look like it was done on a computer.

PowerCADD lets you draw like that, and it doesn't get in your way. Draw floor plans. Machinery. Charts. Sketch a bush. Doodle a cloud. A flower.

You can draw anything with PowerCADD. And it's easy.

PowerCADD

Turn your genius loose. Put some fun back into your life. Order PowerCADD.

3 reasons why we chose Splash over Fiery...

Paul Kalil, V.P. Operations
WYSIWYG PREPRESS

Dave King, President
WYSIWYG PREPRESS

the only
one you'll
need to know
is superior color quality.

Visit the Splash website at <http://www.SplashTech.com>
for the whole story.

Splash
Color Servers

WHEN YOU'RE SERIOUS ABOUT COLOR.

For more information
circle 54 on the reader service card.

More Accurate Color

"We have designers who use our SPLASH prints for sales and marketing, as well as proofs before going to film. Some printers have been so impressed with the quality of the SPLASH proofs that they will run their presses to it."

CMYK and RGB Color Matching — Only Splash Servers give you accurate screen-to-print color matching and the ability to simulate the output of a printing press with standard color inks (SWOP Euroscale, Toyo, SH49). Splash is the first server to enable the color copier to be utilized in discerning proofing and short-run environments. Splash AccuColor RGB color correction provides the answer to the oldest desktop printing problem — monitor blues printing as purple, regardless of file type or rendering choice.

More Consistent Color

"Color calibration is an area that is extremely important to us. We check our calibration twice a day. SPLASH holds its calibration curve very well and when it does slip, it's easy to bring it back in line."

With a Splash Server, calibrating the printer is so quick and easy it can be done several times a day, and without any specialized training. The entire process can be done in a few minutes, on-line and without the need for an expensive densitometer.

More Usable Color

"It's easy to manage and even easier to operate. The SPLASH uses the Macintosh operating system, which we like, and is very familiar to us."

With the Mac-based Splash Server you're free to expand your system with a wide variety of Macintosh software, hardware peripherals and system memory at street prices.

BECAME

A

NO-BRAINER

A mixture of tools so powerful...

we should put asbestos gloves in every box!

CANVAS 5
Complete Illustration, Photo Editing and Page Design

If you already own a graphics application, trade up to Canvas 5 for just \$149.95. See your favorite reseller, or visit us at www.deneba.com for complete product information and secure online ordering. For a Canvas 5 dealer near you, or to order by phone, call 1-800-6 CANVAS or 305-596-5644.

Stop toying with feeble graphics programs that sap your creative energy. Canvas 5 puts everything you need to realize your artistic vision into one integrated program that's ready to rock the second inspiration hits. • Say goodbye to concentration-zapping "launch and quit" cycles. With Canvas 5, absolutely stunning illustration, photo editing, and page design tools are always right at your fingertips. • In addition, Canvas 5 works with any file (from Photoshop™ to CorelDraw™ to GIF, TIFF, and JPEG) and any Photoshop-compatible plug-in. You also get over 20,000 clip art images and 2,000 premium URW™ fonts. • Simple, flexible, and relentlessly versatile, Canvas 5 is an industrial-strength graphics tool. So what are you waiting for? Put the awesome power of Canvas 5 under your creative control today.

New
Version 4.0

Mac OS

"If you're looking for a quick and easy way to create Gantt charts, this program might be just the one for you."

MacUser

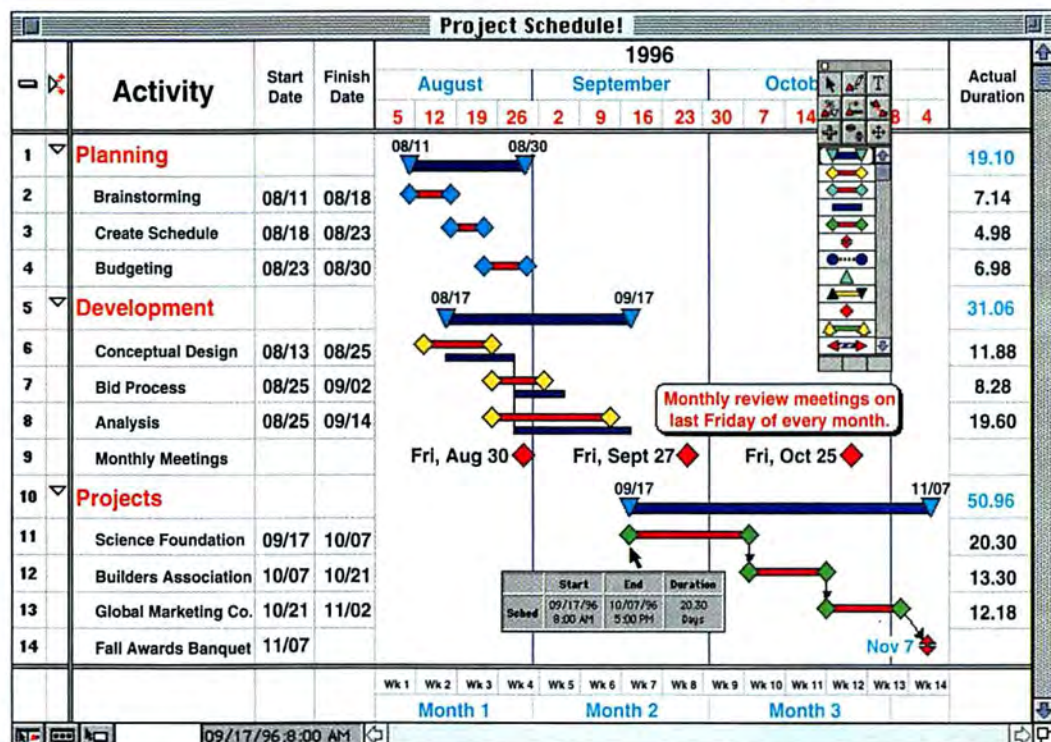

"...An excellent choice for anyone whose primary need is to create precise, presentation-quality Gantt charts."

MacWEEK

Project Scheduling Made Easy.

FastTrack Schedule 4.0™

You can't stay on schedule if you don't have one!

FastTrack Schedule 4.0 lets you create and update presentation-quality schedules quickly and easily. Whether you need a quick scheduler or a full tracking system, FastTrack Schedule 4.0 offers the combination of flexibility, ease of use and power all in one program! Take a quick look at some of the features found in FastTrack Schedule 4.0. Simple scheduling and impressive power are as easy as...1,2,3.

1 Flexibility

- Timescales from Hours to Fiscal Years
- Link Options • Find & Replace
- Paste in Graphics & Add Textblocks
- Custom Bar and Milestone Styles
- Page Breaks • Shift Items in Work Units
- Capture Schedule Defaults • Hide Graph
- Layout Options for Multi-columnar Reports
- Durations in Work Hours & Work Days

2 Ease of Use

- On Line Help Systems • Tool Tips
- Balloon Help • Action Columns
- Control Palette • Auto Scrolling
- Bar Tracking Window • Select All
- Interactive Page Preview Layer
- Cursor Tracking Window • Quick Corner
- Templates • Floating Toolbox
- Autofit Schedule • Auto Resize Row Height

3 Power

- Scheduled, Revised & Actual Dates
- Custom Work Calendar
- Filters & Sorts • Task Dependencies
- Outline tasks to show sublevels
- Import & Export Data as ASCII text
- Network Versions - File Locking, Passwording
- Available for Macintosh, Power Macintosh, Windows 3.1, NT 3.51, NT 4.0 and 95

Would That It Were Be

AS BOTH A NEXTSTEP and Mac OS programmer and enthusiast, I'm excited that Apple is finally investigating a UNIX-based alternative to the Mac OS ("Plan Be," January '97, page 64). However, I do have some reservations.

My primary concern centers around the fate of the Mac OS GUI. Anyone who has used any other OS will concur that no other GUI is quite as refined, simple, and elegant as the Mac's. X Windows and other UNIX GUIs (Nextstep excluded, of course) are among the worst out there. They're ugly, obfuscated, and generally primitive in comparison to the Finder. I've looked at screen shots of the BeOS GUI, and from what I've seen, it doesn't look much better than any X Windows manager — in fact, in some ways, it looks a lot like the worst user interface of all: Windows 3.11.

I support Apple's decision to move to a more powerful, elegant basis for its OS, but if Apple implements OS 8 with Be's front end, the company will upset a lot of users. The Mac will lose its inherent elegance and simplicity — the things that endear the machine to so many users.

Nik Spilka
knspilka@undergrad.math.uwaterloo.ca

I WAS UNDENIABLY GRATEFUL to finally see a comprehensive story on the BeOS. Having followed Be for about a year now, I was heartened and frustrated to see all its promises coming true while the Mac OS continued to flounder. Now the solution is obvious. Even though clones are adding some punch to the Mac market, the lethargic Mac OS is pulling the Mac community down. It's time for Apple

to make the biggest gamble in its history, bigger even than the transition to the PowerPC.

Kenik Hassel
n9440539@cc.wvu.edu

WINTEL USERS will look at the power available to them with a Power Mac running the BeOS and consider it irrelevant, just as they have done with every Macintosh advantage before. In three years, when Windows NT 5.0 ships with the structural strength of the current release of the BeOS, the PC world will still fail to see what it could have had in 1997.

George Bethel
GeBethel@Walrus.com

WHAT'S THE DEAL with the BeOS? I work as a graphic designer and have a ton of little applications and extensions on my machine. If even a single one of these things does not work with the BeOS running on a Mac OS system, then forget about putting it on my Mac. Yes, I would love to have more speed. Yes, I would love to have better stability. But if even one part of the current Mac system software is missing from the new OS, why have it?

I thought the whole idea of updating the OS was to *add* features and functionality, not take them away. Apple needs to look to the core of its user base before making a giant leap to Be. That base is in publishing.

Kevin Barré
BARRE@rhodes.edu

YOUR COVER HEADLINE "Watch Out, Windows" (January '97) could not be more out of touch. Come on guys, the desktop war is over. Ultimately, the only operating system that matters is the Internet browser. Haven't you noticed the little development called Microsoft Internet Explorer and all the flak it's giving Netscape? In the end, what matters is how you integrate the world of the Internet with the desktop. The browser is the operating system.

Kevin Fletcher Tweedy
kft@who.net

Open Folder

What a month. Godish@aol.com assailed us as "SPOILED MAMBY PAMBY WHINING JERKS." CMBUELL@aol.com derided us as dim-witted whiners. And Tom Trinko characterized us as liberals, whose "only acquaintance with logic is that [the two words] share the same first letter." What brought this on? Think Hormel canned meat product. Think *spam* (the unsolicited junk mail that taxes your time, finances, and computer resources by filling up your e-mail in-box).

In our January issue, we touched off a firestorm by audaciously suggesting that advertisers not be allowed to use such intrusive means of peddling their wares. The populist in Godish rebuked us "rich folk" for concerning ourselves with this triviality when problems such as homelessness, unemployment, and evil multinational corporations prevail. The barbed-tongued elitist in Godish yearned for the day we "get downsized and have to work at Burger King." The Constitutional in Godish closed by suggesting that we "develop a little respect for the freedoms our forefathers fought and died for."

With less vitriol, CMBUELL pointed out that spam should have no financial impact because anyone who didn't already have an unlimited-access online account was simply stupid.

Soothing words for Tom Trinko, who dislikes spam for the very reason that he *does* have to pay for the deluge of junk. Tom chided us for not giving the fight against online pornography as high a priority as the fight against spam. Said Tom, "You're going to tell me the Founders intended the First Amendment to protect pornography but not advertising, even though pornography was illegal back then and advertising wasn't." No, Tom. Those logical, liberal Founders ensured that we were free to do and say certain things *and* that we were free from having the things others like to do and say crammed down our throats at *any* expense to ourselves. Pornography may be an unsavory temptation to your young loved ones, and we hope you can convince them not to go and seek it out. But attempting to draw parallels between a temptation and a costly intrusion is, well, highly illogical.

WRITE TO LETTERS

c/o MacUser
50 Beale Street, 12th Floor
San Francisco, CA 94105

The Rainbow Connection

COMPARING THE OUTPUT quality of dye-sublimation printers is tricky, and we appreciate the complexity of putting together "The Burden of Proof" (December '96, page 96). We are concerned that the testing methods used by MacUser Labs may have misled your readers about digital proofing systems, particularly with respect to the Imation Rainbow Model 2730.

For the review, Imation provided a Rainbow 2730 proofing system to MacUser Labs. The Rainbow 2730 proofer is a highly sophisticated proofing device, designed for graphics arts, printing, and prepress professionals who require critical color accuracy; a high degree of flexibility; and excellent calibration between hardware, software, and printing media, to simulate actual printing processes.

Because the Rainbow 2730 proofer includes a broad range of options to help users accurately preview printing processes, all customers who purchase the system receive an on-site technical-service visit. We wouldn't sell the product any other way. On-site technical support helps ensure that busy professionals do not experience the potential frustrations involved in setting up a new system. Further, this support ensures proper optimization of, for example, color tables and base materials, to accommodate customer-specific workflows. Unfortunately, MacUser Labs declined this service. We believe the image and color problems described in the test results obtained by MacUser Labs could have been avoided with this up-front assistance.

We believe that the "Features of Dye-Sub Printers" table was also misleading. It indicates that Imation offers a 90-day warranty for the Rainbow 2730. That oversimplifies our comprehensive customer-support program. Imation provides initial on-site technical support for the first 90 days of use. We also provide 24-hour phone support to all Rainbow customers for the life of the product. After 90 days, customers have the option of purchasing an extended on-site service agreement.

As we introduce new products, we look forward to supplying MacUser with the products for testing. It is our desire that the entire Imation product and service package offered to our customers will be included as part of the testing procedure.

Chuck Oesterlein
Imation

/ At no time in the course of our researching products and preparing testing did Imation offer on-site

setup. The printer we received included all manuals and instructions necessary to set up and test the printer, and given our real-world testing environment — which mimics the experience of ordinary users — we proceeded to do so. We encourage Imation to better alert purchasers to its setup options and to any additional costs such as options entail. Furthermore, we report on service contracts and warranties as included in the purchase price of a product. We do not report on extended warranties that may be purchased separately, as many are not directly under the manufacturer's control. / JP

Clones Aren't Clones

YOUR COMPARISONS of UMAX clones with Power Computing clones (see review, January '97, page 33) is essentially flawed. Two cases in point:

You fail to mention that the Power clones ship with Speed Doubler. Comparisons between a clone plus Speed Doubler and one without are essentially worthless. Disable Speed Doubler on the Power machines and report that benchmark for a change.

The UMAX SuperMac S900 with a 225-MHz chip is shipping, so why is the report on a prototype? Does this indicate the article was rushed to publication without the intent of being thorough and accurate? In particular, your review claims low benchmarks for graphics on the UMAX machine compared to Power machines. Why were the tests done with a 4-MB IMS TwinTurbo card instead of the 8-MB card with which the system ships?

If these benchmark tests are to be informative and worthwhile for a particular subsystem, extraneous variables need to be isolated and equalized.

Paul Cheng
pccheng@nww.edu

/ We test Mac OS systems as they ship from the manufacturer. If Speed Doubler (or any other performance enhancer) comes installed on a system, then its presence is reflected in our test results, as it would be in any user's out-of-the-box experience. We do not mouse-rate prototypes. UMAX certified the SuperMac S900/225 we tested as a production unit, but as mentioned in the review, the company changed the shipping configuration when it was too late for us to retest it (or drop the product from the review). For a full report on the final shipping system, see this month's "Which Mac?" story. / JSA

Quicken Miscalculation?

YOUR GLOWING REVIEW of Quicken 7.0 (see review, January '97, page 38) was apparently based on inadequate testing of the

program's features, judging from the problems Intuit has already fessed up to in its AOL support forum so soon after the product release.

Quicken inaccurately records stock splits. Users have experienced errors when updating files from version 6 and have also been unable to connect properly for electronic registration. When updating stock prices, the program loses track of currently selected stock. And when you're entering checks on the check form, if QuickFill fills in an amount for the first match and further typing then changes the payee, the amount remains the same instead of changing to the correct amount. There are also inaccuracies in the manual — including the omission from the back cover of the keyboard commands, repeatedly referred to in various places within the manual. These are hardly obscure or exotic features, and your reviewer should have tested them!

What's particularly galling is that the exact same thing happened a year ago with the release of Quicken 6. The support forums were overflowing with the anguished wails of users swamped with problems that Intuit reps cheerfully admitted. Not least was the vaporous "online banking" feature on which so much of Intuit's advertising depended.

Philip Brandes
PhilipB023@aol.com

/ It's true that Intuit has acknowledged several bugs in Quicken 7.0 and Quicken Deluxe 7.0, but many occur only sporadically or only on certain machines; if they had occurred during our extensive testing, we certainly would have mentioned them. The most grievous problem — mishandling of stock splits — was unfortunately not an issue in the real-world test portfolios we used for our review. / JSA

No Sacrificial Spam

I DUNNO ABOUT Andy's column on spamming ("Junk-Mail Jihad," January '97, page 212). I'd rather live with the junk mail than get the government involved. The cure might be far worse than the problem. No, I think it's better to work this out by using market forces and civil courts. As far as I'm concerned, using the government to fix this problem is akin to swatting a fly with a Buick. Call me idealistic or whatever you like, but I say we avoid that kind of power — the Dark Side.

Griff Miller
miller@positron.com

Corrections

The correct author of the MovieStar review in our February '97 issue (page 49) was Jim Shatz-Akin.

If our amazingly fast and accurate scan doesn't impress you, maybe you should consider a re-shoot.

INTRODUCING THE EPSON® EXPRESSION® 636 COLOR SCANNER

Everything the camera sees, it sees. And we mean everything. Because Epson TrueScan™ technology with 36-bit scanning gives you the power to accurately recognize 68.7 billion colors and 4,096 levels of gray—more than you'll ever need. 600 dpi optical resolution (4,800 dpi max) lets you capture the most minute detail with incredible clarity—like the soft edge of a raging storm cloud. And you'll get your perfect image in a lot less time than

from other high-end graphics scanners. For a lot less money.

But the Expression 636 isn't only about great images. Text Enhancement Technology and Auto Area Segmentation let you accurately scan both text and graphic images from the same page—even from colored backgrounds. SCSI and bidirectional parallel ports allow easy, simultaneous hook-up to both Mac and PC systems. And our TWAIN driver is full of features like PhotoQuick™, which lets you turn negatives into high-quality positives. So you'll have images that will blow you away. And if by chance they don't, what you need is a better photograph. For more info, call 1-800-GO-EPSON. Ask for operator 3020.

In as little as 6 seconds, you can preview images before you scan them. Even tornadoes don't move that fast.

Our professional Mac bundle comes with full versions of Live Picture™, Claris HomePage™, e. Paper™, Kai's Power Tools™, SCSI cable, and a transparency unit. Because a scan this intense is bound to inspire.

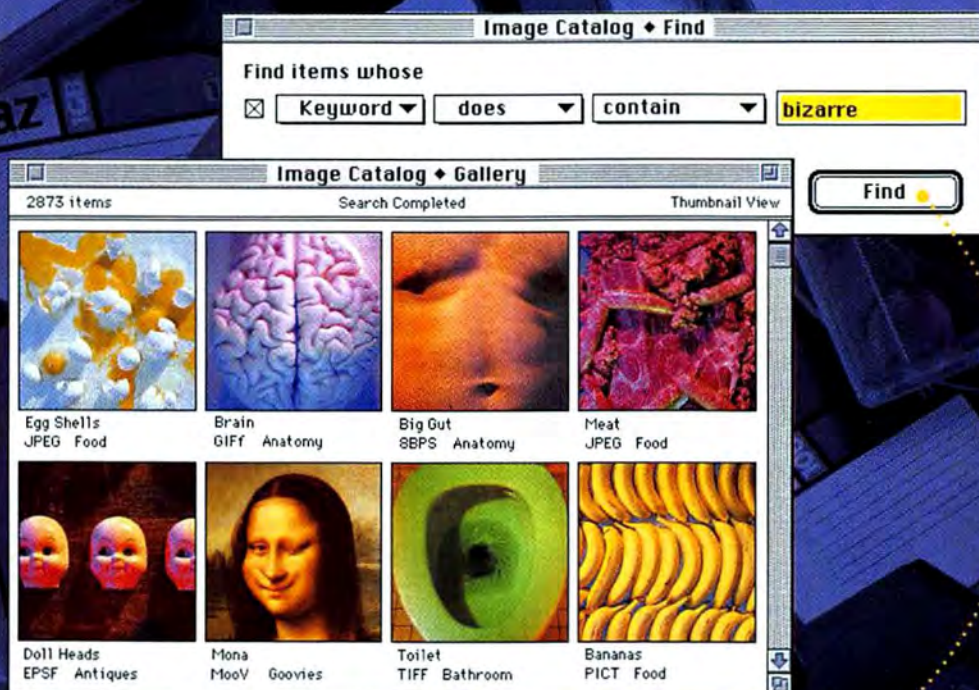

YOU'VE GOT TO SEE IT IN **EPSON** COLOR™

CIRCLE 122 ON READER SERVICE CARD

Professional PC bundle also available with full-version Adobe Photoshop™, Xerox TextBridge Pro™ '96, NewSoft™, Presto! PageManager™ LE, Claris HomePage, Kai's Power Tools, SCSI interface and cable, and a transparency unit. Other scanner configurations available. Awards given to the ES-1200C, one in the line of Epson award-winning scanners. Do not scan published material without permission of the copyright holder. PAMELA PFIFFNER

Who's NeXT?

EVERYONE KNOWS STEVE JOBS. Cofounder and former CEO of Apple, he's the man who coined the phrase *insanely great*, the man who created the very culture in which the original Macintosh grew. But, who's NeXT? Besides being that thing Steve Jobs did after he left Apple, NeXT Software has never risen much above the din of a marketplace obsessed with more-mainstream operating systems.

Steve Jobs' return to Apple is a stroke of marketing genius. How better to reassure the hoards of loyal Mac users than to embrace one of the men responsible for it all? Jobs has proven himself an articulate defender of the Macintosh. I'm especially thinking of his Oscar-worthy performance in the PBS special *Triumph of the Nerds*, in which he waxed poetic and wistful about the Apple that existed before he hired his personal Judas, the man known for his prowess in marketing colored soda water. Jobs is a man who embodies the passion that the Mac has always stirred in the hearts of its users. A passion that has been missing at Apple — for way too long.

The sheer charisma and marketing savvy Jobs brings back home is worthy of celebration, but there's more to it than that. Jobs is a visionary. He has always been ahead of the curve, sometimes too far out. He created a market for the Macintosh where one did not exist, although arguably his refusal to license the Mac OS ultimately led us to today's state of affairs. More than that, he saw that giving the powerful but arcane UNIX environment a graphical interface held potential, even if he had difficulty marketing his Nextstep operating system. Now it's emulated by Sun, Hewlett-Packard, Digital, and Silicon Graphics. Jobs has an excess of vision, if not business acumen.

Boy Story

But let's face it, Jobs is back at Apple only part-time — and only as an advisor. Not that I'd underestimate the potential impact of even a part-time Jobs. However, the real question before Mac users is, What is this NeXT thing

anyway, and why should I care?

Taking a cue from Jobs' latest success, the computer-animated movie *Toy Story*, think of it this way: The Mac OS is level-headed Woody, and Nextstep is slickly futuristic Buzz Lightyear. Both must band together to fight off Bill Gates, er, Sid, the nasty kid next door who

crafts mutant toys, er, operating systems, out of salvaged parts.

Although Nextstep may not be well known among the rank and file of computer users, the digital elite — in search of a powerful workstation OS that still retains the ease of use and joie de vivre of the Macintosh — have embraced it. Among the computer industry's cognoscenti, Nextstep has long been respected as the premier platform for building object-based applications. Those entrusted with building Corporate America's next-generation data infrastructures get misty-eyed at the mention of WebObjects, NeXT's Swiss-army knife of intranet development. And then there's Nextstep's legendary stability — it almost never crashes — a condition Mac OS users can only dream about.

It is the combination of these two proven operating systems that could win the day for Apple and NeXT — the Mac OS for its broad market appeal and Nextstep for delivering

modern extras that might just catapult the combined platform ahead in the race to be best on the Internet.

Nextstep is the reason Mac users should be excited about Jobs' return.

There are also plenty of risks associated with Jobs' homecoming. It's 11 years later. The world has changed. The Mac has changed. We have changed. And Jobs' return to Apple could appear a sign of desperation, another sad attempt to regain faded glory. Amelio risks presenting the computing pioneer as an aging rock star trying to go back out on tour one more time — much like the Who regrouping to perform *Quadrophenia*, complete with microphone tosses, windmill guitars, and high hopes for boffo box-office sales.

But it all comes down to this: Can Steve Jobs deliver the modern platform Mac users have been waiting for? Although NeXT offers a lot of exciting possibilities (as has always been the case with Apple), the destination is not the problem, the journey is. That's where the rubber meets the road, and therein lies Apple's most formidable challenge.

Elsewhere in This Issue . . .

This month we also introduce two new columnists to the pages of *MacUser*. Long known to our readers as our lead technical writer on issues such as the Mac OS and clones, Henry Bortman is also our resident curmudgeon. His new column will serve as a forum for voicing concerns about Apple, the industry, and Mac products — from the user's perspective.

Those of you who cruise the *MacUser* Web site (<http://www.macuser.com/>) and read our Internet coverage in the pages of the magazine will be familiar with Jason Snell. His new column, *Net.cetera*, will focus on the tools, techniques, and trends that will continue to make the Mac one of the leading Internet and intranet platforms. ☞

Multiply and conquer.

[Quark**Immedia**.]

Add multimedia to the equation. QuarkImmedia makes it easy.

To make an impression on the Web, an intranet, a CD-ROM, or anywhere else multimedia is the medium, you need precise control over a wide array of variables. Like sound, video, and animation. Special effects transitions, complex interactions, and hot links to cool spots online. QuarkImmedia™ gives you control over each of these dynamic elements in a single point-and-click authoring environment. No separate servers, plug-ins, or programming required.

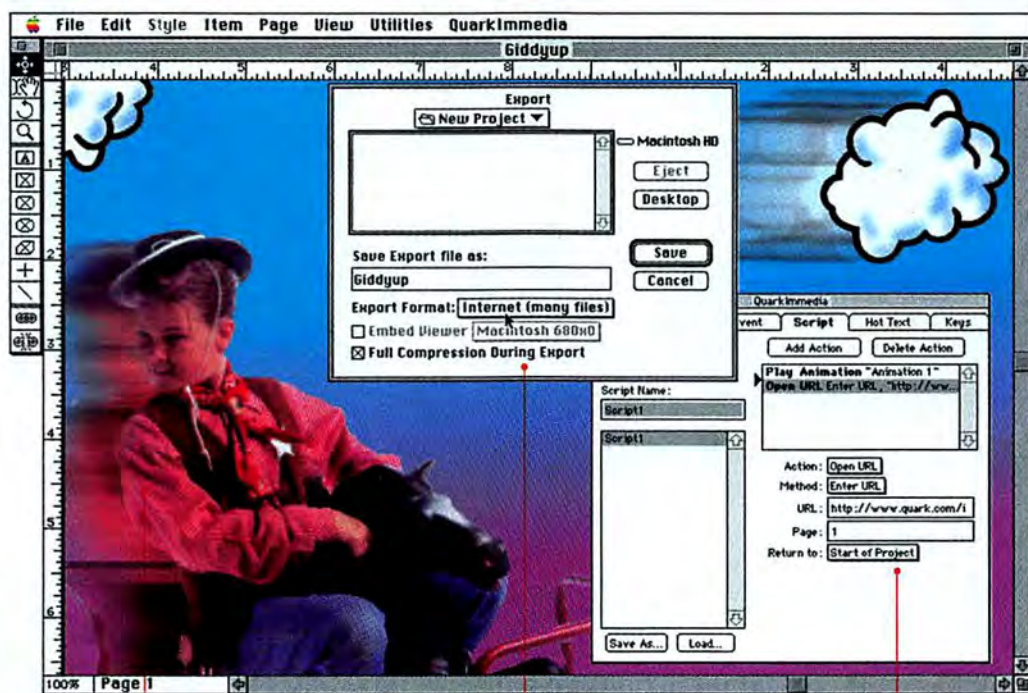

With QuarkImmedia you get frame-by-frame animation, custom compression settings, and

automatic calculation and simulation of Internet download times. Your audience gets streaming audio and real-time interactivity on the Web with the royalty-free QuarkImmedia Viewer.

And because it works with QuarkXPress™, QuarkImmedia lets you (and your clients) capitalize on investments already made in content, software, and skilled personnel. So you can adapt existing print assets for the screen without going back to square one — and without forfeiting one iota of the design control you have on paper. *Multiply your opportunities without dividing your creative energies.*

Look for special bundle pricing on QuarkImmedia and QuarkXPress.

Incorporate sophisticated animation into Web content without having to deal with programming, plug-ins, or applets.

Caching, compression, and multiple-file architecture optimize performance at any bandwidth.

Any object can be used as a link to another QuarkImmedia or HTML site.

QuarkImmedia. For the interactive imagination.

For a free demo package, call 1-800-788-7835 Ext. 3027

PowerBook Monopoly

SOMETHING'S MISSING. Today there are over 40 different Macs and Mac-compatibles on the market. Now, you could survey this scene and say, Hey, Mac OS licensing is really beginning to work. Look at all the choices we have. Look at all the ways clone vendors have found to innovate. Look at the range of performance, the variety of bundled hardware and software, the price options available.

Or you could say, Where the hell are the laptops?

Let's survey the stirring selections available to us from Apple: There's the PowerBook 190 series, the only remaining Macintosh products that don't use PowerPC chips. I'm sure lots of folks are chomping at the bit to ride that wave into the future. There's the 5300 series. These are particularly popular in chemistry labs, where they double as Bunsen burners — but don't get me started.

And there's the new 1400 series, which everyone (*MacUser* included) seems to be falling all over themselves to sing the praises of, due mostly to the fact that it's not awful. I know, it's got a built-in CD-ROM drive, which PC portables have had for over a year. It's got a nice screen. Well, duh. It's easy to take apart. My kid will like that. And it lets you make personal fashion statements by sliding a tacky Book-Cover into the lid. There's a sell.

But for charity's sake, let's call these pluses. Then you turn it on — and realize you've just spent \$3,500 on the slowest Mac system you can buy — by a long shot. It's barely faster than a Power Mac 6100/60. For those of you with short memories, the 6100/60 was the slowest of the original Power Mac models. Apple discontinued it two years ago. Sycophants will tell you that it's OK for portables to be slow. After all, they're just, well — *portables*. Customers who use their portables to run their businesses will use more colorful language.

This is a situation crying out for clone

competition. Do you think Motorola, maker of cell phones so cool that Paramount nearly sued it for stealing Captain Kirk's flip-phone "technology," might be interested in making Mac portables? Or Power Computing, whose busy little engineers have been seen disassembling Mac and PC portables alike, searching

have the engineering staff to support a clone license for portables, you suggest. I haven't heard that there's a hiring freeze at Apple recently. How many engineers would it take? Two? Three? That doesn't seem an unreasonable cost for Apple to bear to enable the growth of the Mac-portable market.

Or maybe, just maybe, Apple *likes* having a monopoly on Mac portables. Maybe the notion of some third party offering an alternative to the disaster known as the PowerBook 5300 was just a bit too much for Apple execs to swallow. Maybe they'd rather see customers who need advanced portable-computer technology switch to Windows machines. At least there are choices on the Wintel side.

I'd like to tell you a clone laptop is just around the corner. But I'd be lying. At this point, it looks like we're going to have to wait for the PowerPC Platform before we see third-party portables. And there isn't even a spec for PPCP-based portables yet. My prediction: Check in around Q1 1998.

In the meantime, I'm holding onto my 540c. The little hook that keeps the lid shut: It broke off. I have to hold the lid closed with a bungee cord. The little

piece of plastic in the back that's supposed to protect the ports: It broke off too. The retractable feet: They collapse at random intervals while I'm typing. And I seem able to charge my batteries properly only when the full moon falls on a Thursday. But it's got built-in Ethernet and a 28.8-kbps modem. And I've upgraded it with a Newer Technology 117-MHz NUpower PowerPC processor daughter-card, which puts it neck and neck speedwise with a 1400 — not bad for a system built nearly three years ago.

Yup. That 540c is a darn solid little computer, perhaps the best portable Apple ever made. I bet some clone vendor would just love to bring the next 540c to market. ☞

for the magic formula, as far back as a year ago? Would UMAX jump at the chance to jump into this market? You betcha.

So where are they? Well, it works like this. A clone vendor that wants to produce a Mac-compatible system goes to Apple and says, We'd like to license such-and-such design. Apple goes, Think, think, think. Engineers talk. Lawyers talk. Bean counters talk. Then Apple comes back to the clone maker and says yes — or no. In the case of portables, it's always been no.

Wait, you protest, rushing to Apple's defense. Maybe the clone vendors *haven't* asked if they could license portable designs. Trust me, they've asked. Maybe Apple just doesn't

For a Mac lover, it's a wish come true.

Introducing StarMax. Go ahead, pinch yourself. Motorola has launched an entire line of Mac OS-based desktops and minitowers running on PowerPC™ technology. Everything from 180 MHz to 240 MHz, 1.2GB to 2.5GB hard drives and starting at about \$1,595.* So now, you have a Mac OS alternative with an industry-low price. And with the assurance of the Motorola brand, you're getting the quality you'd expect from a global company. In fact, we're so sure of it, we gave all of our StarMax systems a five-year limited system warranty—the only one like it in the industry. And **PowerPC™** with our new board design, Motorola systems running on the PowerPC 603e™/200 MHz microprocessor outperformed other Mac OS compatibles running the same chip (even one running at 240 MHz)!† Call us if you still think you're dreaming. You can consider it a wake-up call.

What you never thought possible.™

Apple's Next Step

The next Mac OS will be the NeXT Mac OS.

APPLE HAS MADE ITS DECISION. The next step in Apple's Mac OS strategy is to use Nextstep, the UNIX-based operating system from NeXT Software — a company that's now lock, stock, and Steve Jobs a part of Apple Computer, after a \$400 million announcement late last year.

Nextstep beat out several contenders — the BeOS, from Be; Sun's Solaris version of UNIX (spiked heavily with Java); Windows NT (which didn't even make it to the semifinal round); and a homegrown OS developed entirely within Apple — for the right to serve as the foundation of the Mac's future OS. Given that hardly anyone in the Mac community has even heard from NeXT in the last few years, Apple's choice might seem a curious one. So why did it do it? What's so great about what NeXT brings to the table?

First of all, although Nextstep isn't what would likely spring to mind if someone asked you to name a popular operating system, the NeXT OS has been around for over ten years — it's had time to mature

and is now stable and reliable enough to be used by several large corporations for critical business applications.

In addition, it already contains many of the features that Mac users would expect from an Apple operating system. It supports the Mac HFS file system. It implements plug-and-play for PCI add-on cards. It enables applications to be localized easily for the international market. It has AppleTalk client software for connecting to servers and printing (although

it doesn't currently support AppleShare-based file sharing). Nextstep

also currently supports power management on Intel-based notebook computers, so that aspect of getting it to run on PowerBooks should be a relatively easy task.

A FIRM FOUNDATION

But although these are bonuses that will simplify the task of integrating Nextstep with the Mac OS, System 7 already does all these things too. So why switch? What are the advantages that the Nextstep OS's

foundation provides? In our January story on the BeOS (see "Plan Be," January '97, page 64), we laid out several fundamental technical criteria by which Apple's new-OS strategy should be evaluated: The new OS would need to be object-oriented, to provide full memory protection for applications and modern virtual memory, and would need to support preemptive multitasking, multithreading, and symmetric multiprocessing. Our initial research into Nextstep indicates that it can meet all these criteria when ported to PowerPC-based systems.

Yet it appears that Apple's acquisition of NeXT is motivated as much by the company's interest in becoming a key player in the enterprise/intranet market as it is by concern for the future of the Mac OS. It may well be that in choosing NeXT's offering over Be's, Apple was wowed by NeXT's WebObjects technology as much as by Nextstep and its cross-platform implementation, Openstep. After all, conventional wisdom these days is that the advent of the Internet may soon make users' choice of OS irrelevant.

*Currently running on Openstep-based systems.

†Currently running only on Intel-based notebook computers.

‡Printing is supported; AFP client software is provided.

WebObjects is indeed a cool piece of technology. It greatly simplifies a corporate customer's task of integrating its existing databases (the lifeblood of many businesses) with the World Wide Web (the hot new thing). For businesses trying to reach customers on the Web or to move their internal communications to a corporate intranet, WebObjects has much to offer (see the "More Than a New OS" sidebar).

QUESTIONS REMAIN

But that doesn't mean that merging all Nextstep has to offer with the best of the Mac OS (both System 7 and the ill-fated Copland) will be easy. Short of a miracle, it's unlikely that Apple can deliver such a super-OS before 1999. The list of technical issues to be addressed for such a merger to succeed is formidable. Chief among them is that Nextstep doesn't currently run on Mac hardware. Coming in a close second on the issues list is Nextstep's imaging model: It is based entirely on Display PostScript, whereas the Mac OS is based on QuickDraw.

These are just the tip of the iceberg. Most of Apple's technologies — the QuickTime Media Layer (which includes QuickTime, QuickTime VR, QuickTime Conferencing, and QuickDraw 3D), ColorSync, Speech Recognition and PlainTalk, QuickDraw GX, OpenDoc, Game Sprockets, Apple Guide, and the Mac OS 8 Macintosh User Experience (the

Copland customizable desktop) — need to be made reentrant and need to be ported to run on top of a Nextstep foundation. And although Apple has said that the first iteration of the new Nextstep-based OS won't run current Mac apps, users will certainly clamor for a future version that adds System 7 compatibility for running their existing Mac apps. That's a lot of work.

And remember: We're talking about the same Apple that took months just to deliver Mac OS 7.6, which required only that the company collect a bunch of already shipping OS bits and pieces and run it through QA — an "accomplishment" eerily reminiscent of The Old Apple, which worked on Copland for three years and never even coughed up a beta release.

WHAT TO DO NEXT

In fact, Apple has no intention of delivering the ultimate new OS in 1997. Quite the contrary: What Apple is likely to give you in 1997 is Nextstep ported to run on Power Mac hardware. Period. Apple has already admitted that System 7 compatibility will come later. How much later?

And what will it look like? At press time, the company wasn't prepared to say.

A largely unmodified Nextstep that doesn't run System 7 applications may be of questionable value to developers. Why would they want to write applications for Nextstep in its current form when much of it — the fundamental graphics model and the basic user interface, for example — might well change in the final merged OS? And as for users, Nextstep running on Mac hardware will be little more than a curiosity until enough compelling applications are available.

Instead of rushing to market with this System 7-hostile release, Apple could have chosen to delay delivery of the first implementation of the new OS until it had time to do more integration of Nextstep and Mac OS technologies. It could have chosen to resolve the graphics-model issue; or to implement the Mac OS 8 desktop look and feel in place of the Nextstep interface; or to port the QuickTime Media Layer to run on top of Nextstep; or to begin the task of making Mac OS APIs reentrant, so they could take full advantage of Nextstep's preemptive multitasking; or to integrate OpenDoc and Cyberdog with Nextstep's object model; and certainly to provide

Apple appears as interested in the enterprise/intranet market as in the future of the Mac OS.

HOW DOES NEXTSTEP STACK UP against System 7.5 — and the operating systems it beat out in the contest to be System 7.5's successor?

The BeOS represented a remarkable improvement over System 7.5 and the original Mac OS 8 as planned — but it's still under development. So, although it meets all the requirements of a modern OS — Nextstep does as well — it would have taken Be or Apple some time to deliver a stable OS and for commercial applications to follow. Nextstep, on the other hand, has been shipping for years and has a stable technology base. Applications? Well...

Nextstep already has important components that are either missing or not yet delivered in the BeOS. These components will ease the transition to Apple's OS future: AppleTalk printing and file access and Macintosh file-system support already appear in the current, shipping version of Nextstep. Also supported is notebook-computer power management, albeit only for Intel-based notebooks. These are items Be wouldn't have delivered for some time, making the transition to an out-of-house foundation for its next OS more difficult for Apple. With Nextstep, Apple already has a head start. / JEFF PITTELKAU

System 7 compatibility — all these would be welcome steps toward a final hybrid operating system.

If Apple were to pick the right set of items to integrate before delivering a new OS, it could provide developers with a solid new API that their applications could take advantage of. That, in turn, would speed users' desires to make the transition to the new OS. But don't expect any of this in the 1997 release.

Having shelled out \$400 million to NeXT in part to acquire a modern OS that Apple could get out the door quickly, the Cupertino brain trust has convinced itself this is the best course — regardless of whether or not it's the best idea. Oh, well. *Plus ça change, plus c'est la même chose* — which, as Jean-Louis Gassée could tell you, means the more things change, the more they stay the same.

Like it or not, Apple's new path is set: The future of the Mac has NeXT written all over it. All that remains to be seen is what Apple will be able to deliver beyond the Nextstep of today, when it'll be able to deliver it, and whether enough Mac customers will be willing to wait for it.

For those of you who aren't ready to take the next step, take heart. Apple has a fallback position. The company plans to continue its semiannual releases of Mac OS 7.x for years to come.

More Than a New OS

Powerful Web and development tools sweeten Apple/NeXT deal.

FORGET NEXTSTEP — at least for a moment. Put aside your concern over the challenges that Apple will face in transforming Nextstep from the NeXT OS into the next Mac OS. Take a look, instead, at two other NeXT technologies Apple acquired when it made \$400 million worth of nicey-nice with its ex-founder: WebObjects, which offers a powerful way to share live information from multiple sources over the World Wide Web, and Openstep, a cross-platform, object-oriented development environment.

Instead of viewing your Mac as a desktop computational island where the OS is king, think of its role in a multi-OS community, sharing information, sharing application-development efforts. Sure, this is a new way of looking at computing and it entails a bit of a paradigm shift, but as they say, "shifts happen."

This particular shift gives Apple the opportunity to be more than merely the manufacturer of a great desktop system that dominates important — albeit niche — markets. If Apple succeeds in fully exploiting *all* of NeXT's technology, instead of merely cannibalizing what it needs to cobble together a replacement for the ill-fated Copland, it could take the lead in a new OS-agnostic

world of shared information distribution and application development. If Apple fails . . .

WEBOBJECTS

WebObjects is a server-based technology that can package practically anything — data from a corporate database, Java and ActiveX applets, Shockwave and RealAudio files, data-acquisition forms — and insert it into HTML pages that it builds on the fly, in response to a client's request over the Web. It can also take any information provided by a user on a client computer and distribute it, as appropriate, to any database or other information-storage entity to which it is connected.

All this happens transparently to users. Since WebObjects is browser-independent, a WebObjects application can be accessed from Netscape Navigator, Microsoft Internet Explorer, versions of Mosaic from NCSA or Spyglass, or any other HTML browser. WebObjects supports Java applets, HTML 3.0, Netscape extensions to HTML, and SSL-secured links to a Netscape Commerce Server. WebObjects applications can hook up to an HTTP server through the standard CGI HTTP interface, NSAPI (Netscape), or ISAPI (Microsoft). WebObjects is designed as a

BETWEEN THE LINES / BY ANDREW GORE

Apple's Iron Lady of R&D

NO-NONSENSE is a term often heard to describe Ellen Hancock, who joined Apple in July 1996 as chief technology officer. Some of her employees have even honored her with a nickname — The Iron Lady — which, considering the indecisiveness of her predecessors, is a considerable compliment. I talked with Hancock just days before Apple's announced acquisition of NeXT; here are some excerpts from that conversation — *along with our interpretation of her comments.*

AG: Where is the excitement about the Mac platform going to come from over the next few years?

EH: Well, first of all, I believe we are working toward a strategy that will provide us with an OS

Ellen Hancock

that responds to our customers' needs. Second, we have a fair amount of work going on relating to the Internet that will be very positive. Third, the combination of Java and OpenDoc will be an important part of our future.

Apple is betting big on Java to help the Mac regain its edge and help make it an equal, if not superior, citizen on the all-important Internet.

AG: What, specifically, are the things you will be doing on the Internet?

EH: We're very focused on the integration of the Internet with the operating system and what the user experience will be like relating to getting access to data. We are absolutely committed to

providing offerings that allow people to get access to the Internet, helping people come up with a Web page, helping people install a Web server.

As Hancock will tell you herself, the Mac is doing quite well on the Web, with 64 percent of content creation, a healthy chunk of Web servers, and 20 percent of all surfing. The company's problem is to get the market to notice Apple's success.

AG: Is Copland dead, and if Copland is dead, why did you decide to kill that project?

EH: We planned to deliver at the end of next year an operating system that attempted to solve two problems: compatibility and providing new functionality. The plan also said that we would not add new OS functionality to System 7 until Copland shipped and that when Copland shipped, we would convert users to the new OS.

I believe those were flawed proposals. The world has never known an overnight conversion to a new OS, and I didn't think Apple would be able to be the first to make such a thing happen. And a year

complement to, and not a replacement for, Java, since Java services concentrate on the client side and WebObjects services focus on the server side.

The advantages that WebObjects has over a standard HTML-on-an-HTTP-server Web site are many and varied. The first and most obvious one is that since HTML is created on the fly by a WebObjects application, pages can be customized for each user. For example, if you fire up your Mac, launch Microsoft Internet Explorer, and access a product-catalog site, you might find not only a page personalized with your name, address, and order number but also a catalog that offers selections tailored either to your purchasing history or your pre-stated tastes.

More important from the catalog-publisher's point of view, the information appearing on that page can come from any number of sources — whether or not those sources use the same data-storage architecture. For example, one page could contain data from Oracle, Sybase, Informix, DB2, flat-file, and ODBC-compliant databases plus data from any number of image-file sources. A WebObjects application can even yank data out of an Excel spreadsheet running on a Windows NT server.

In addition to having access to sources of data running on various hardware, WebObjects applications (written in C, C++, WebScript, and Objective C, with Java, JavaScript, and Visual Basic Script support under development) can run on multiple server platforms, including Windows NT-,

Solaris-, OpenStep-, and Nextstep-based ones. And if your site starts to get too popular, you can spread the load by adding more WebObjects servers, bypassing the DNS-registration hassles of adding more HTTP servers — since WebObjects information management can take place on a different hardware platform from the HTTP server, the processing load can be more effectively balanced.

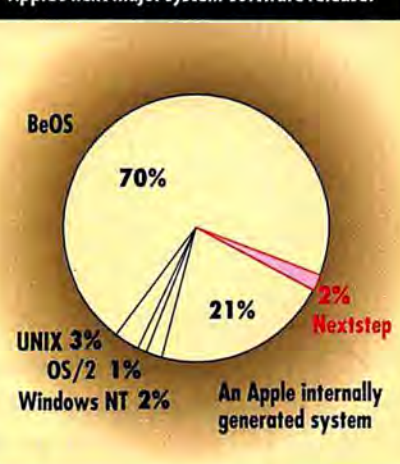

Currently, NeXT offers three WebObjects products: WebObjects, the entry-level version, is available free from NeXT's Web site (<http://www.next.com/>) — but don't bother downloading it if you're not running Windows NT, Solaris, or Nextstep 3.3. The free version of WebObjects will allow you to build simple interactive components, using an interpreted language. The midrange product, WebObjects Pro, lets you distribute your WebObjects applications across multiple servers and integrate them with Microsoft OLE. It adds the ability to compile in C, C++, and Objective C and includes a drag-and-drop development tool. The top-of-the-line WebObjects Enterprise is required for linking up to industrial-strength databases.

OPENSTEP

A major strength of WebObjects is that it's object-oriented — that is, a WebObjects application is built out of components either supplied in the development environment or created by the developer and then reused in other applications, as needed. The savings in application-development time — and

ONLINE POLL

Q. What should be the foundation for Apple's next major system-software release?

money — can be substantial.

This object orientation is the core of Openstep, the other Toy Surprise inside the NeXT acquisition. (In fact, object-oriented development is the core of NeXT's entire product line.) Openstep is an object-oriented application-development environment based on the popular and highly acclaimed application-development features of Nextstep.

Openstep's claim to fame is that it makes applications easy to develop and easy to customize and that it makes it easy to create applications that run on different platforms. Once you start developing Openstep-based applications, you can reuse the objects that comprise them in future applications. The more you develop applications by using Openstep, the more component objects you develop and the easier and faster it is to develop your next application.

Currently, Openstep includes a drag-and-drop development environment equipped with reusable interface objects that provide the look and feel of our old friend, Windows 95. These applications will currently run under Windows NT, Solaris, and MACH (the UNIX kernel that is at the heart of Nextstep). The make-or-break question, of course, is if and when Openstep will be modified to create Mac-like applications that can run on Mac OS whatever on a PowerPC.

In any case, the dynamic duo of WebObjects and Openstep — and the future they represent — may be why Apple chose to bet on NeXT. Despite the attractiveness of the competing Be deal, the BeOS is merely an OS. / RIK MYSLAWSKI

and a half was a long time to go without new functionality. So we changed the plan to take some of Copland and move it into System 7. When we went back and looked at what was left in Copland, we found that it no longer satisfied our customers' needs.

It is decisions such as these that have earned Hancock her reputation. Killing Copland was critical if Apple hoped to move the Mac OS forward, but few Apple managers would have had the guts to make such a tough decision just weeks after joining the company.

AG. Will Apple continue to support and update System 7 as well as offer a fully modern OS?

EH. I think System 7 will continue for several years. I do understand that developers think a single OS might be easier, but you have to pay attention to customers.

This is likely to be one of the most controversial parts of Apple's new OS strategy. It remains to be seen if software developers will, in fact, support two

OSs or focus their efforts on just one.

AG. What are your goals for the modern Mac OS?

EH. The goals are to provide support for critical customer requirements such as multitasking, memory protection at the application level, multithreading, and SMP (symmetrical multiprocessing). It should also look like a Macintosh. Users should work exactly the same way they do now.

NeXT technology will provide multitasking, memory protection, multithreading, and SMP — but maintaining a Mac "look and feel" won't be easy.

AG. Do you plan to go outside Apple to acquire technology for this modern OS?

EH. The operating system will, over time, be using Java APIs. And I am very open to going outside for pieces of the OS.

The NeXT acquisition — including the company's Java-savvy WebObjects — proved that Hancock was adventurous enough to go outside of Apple for help. But will Apple be able to implement NeXT's technology in time? That's the \$9 billion question.

Microsoft Internet Explorer 3.0 for Macintosh. Does Netscape come with an uninstall program?

Let's look at the facts. Microsoft® Internet Explorer 3.0 was designed for the Mac by our Mac developers to be faster and easier to use. It requires no upgrade since it runs on existing Macs like 680x0 and Power Macs, and it only needs a 4MB RAM partition. (Netscape eats an 8MB partition.) Internet Explorer 3.0 supports Stylesheets, ActiveX™, Java™ and native Mac technologies like QuickTime, QuickTime VR and AppleScript. It gives you lots of killer ways to customize your Web experience, as well as convenient access to e-mail and newsgroups. Microsoft Internet Explorer 3.0 is quicker and smarter and smaller and, incredibly enough, it's free.* You can do a quick download from the Microsoft Web site, or call AT&T for a WorldNet connection and a free disk at 1-800-967-5363 ext. IE3. You may even want to keep Netscape for nostalgic reasons.

Apple, Power to Take DVD Lead

Mac OS-system vendors outline plans for adopting new ultrahigh-capacity digital media.

IT TAKES CHUTZPAH to be the first company to embrace a new technology. Sure, many of us early-adopter types will support an aggressive vendor by plunking down our hard-earned equipment-buying dollars for the latest and greatest in Mac peripherals, but more-cautious Mac users often have a wait-and-see attitude. The rewards for being first can be substantial — but so is the risk.

DVD, the new digital-media standard that's set to explode onto the scene in 1997, offers just this challenge to Mac OS-system vendors — including Apple. And as the day gets closer when you can pop a DVD disc into your Mac or video player and watch two hours of full-motion, full-screen video, complete with Dolby surround-sound and multiple subtitle tracks, Mac OS-system vendors have begun to release details about whether they'll be leaders or followers in the DVD revolution. At this point, it appears it'll be Apple and Power Computing that first take the DVD plunge, with APS, DayStar Digital, Motorola, and UMAX waiting in the wings.

The time is right for DVD — finally. First announced in late 1994, the DVD initiative quickly

became bogged down in a competition between two rival standards. This dispute was finally settled in late 1995, only to be replaced by another argument, this time about encryption technology. This last hurdle was overcome in late 1996, followed quickly by DVD-drive announcements from Hitachi, Panasonic, Pioneer, and Toshiba.

Although every last wrinkle has yet to be ironed out, one measure of unanimity among DVD-drive manufacturers is that they have finally agreed on what the acronym DVD stands for. Originally it was *digital video disc*, but as nonvideo uses became

apparent, Toshiba suggested *digital versatile disc*. The new consensus? DVD doesn't stand for anything: DVD = DVD.

No matter how you define it, DVD will have a major impact on the delivery of digital media of all types, be it video, audio, still images, or multimedia. The simple reason for DVD's versatility is its ultrahigh disc capacity: A single-sided, single-layer DVD disc can hold a full 4.7 GB. Add another layer to the same side — a feature enabled by a new dual-focus hologram laser-lens technology — and the capacity jumps to 8.5 GB. But wait, there's

Take a good look: You may be seeing a lot of this interface in the future, if Apple and Power Computing solidify their plans to use E4's CoolDVD technology. Notice the buttons at the bottom, which enable you to control the subtitle selection, camera angle, and aspect ratio of DVD videos that support these features.

FUTURE TECH

The Perils of Radio Activity

THE MICROPROCESSOR AGE DAWNED a mere 25 years ago, when the Intel 4004 climbed up out of the analog ocean onto digital terra firma. This pathetic 4-bit weakling, comprising a mere 2,300 transistors and stumbling along at a soporific 750 kHz, nevertheless had a unique evolutionary advantage over its analog ancestors: It could be taught new tricks; it could learn.

Because of its intelligence and versatility, the microprocessor quickly rose to the top of the electronic food chain. Today its evolution has led to such 64-bit monsters as the DEC Alpha 21164, which drives its 9.3 million transistors at 500 MHz.

But microprocessors dine on data, and as they've grown bigger and more powerful, their appetites have become more and more voracious. And although their evolution has been swift and sure, the development of their data-serving subsystems has lagged far behind. As a result, microprocessors are beginning to starve. Their metabolisms now process data faster than their surrounding ecosystem (a.k.a. the logic board, ports, and pipes) can supply it. Your Mac OS system's PowerPC microprocessor, for example, whirs along three, four, five, or even six times as fast as the data path that connects it to RAM. It's trapped in that old army snafu:

Hurry up and wait.

The solution should be simple — or so you'd think: Just match the speed of the data path to the speed of the microprocessor, and all should be well, right? Wrong.

If you're sitting in your office as you read this, the bus that just passed by your window gave you a clue as to why the solution to data starvation is not that simple. Did you catch that garish ad on its side? The one for "Live 105: The Randy Rocker's Radio Refuge?" Meditate on its Day-Glo message for a moment.

I knew you'd figure it out. "Live 105" gets its euphonious name because it transmits its smarmy modern-rock love ballads at 105 MHz. If you run a motherboard at a clock speed of that magnitude, it becomes, in effect, a tiny but powerful FM radio

more: The DVD specification allows data to be pressed into both sides of the disc, for an astounding 9.4-GB single-layer capacity and a 17-GB dual-layer capacity — all on a disc the size of a standard CD-ROM.

THE FUTURE OF DIGITAL VIDEO

Using this level of capacity for text-based content makes “overkill” an understatement. DVD’s real target is digital video. To that end, the DVD specification mandates MPEG-2 as the video-compression technology of choice. With MPEG-2, a single-sided, single-layer DVD disc can accommodate an average-length Hollywood feature film.

At this point in the Mac’s evolution, however, playing an MPEG-2-encoded DVD disc requires special hardware — namely, an MPEG-2 PCI card. Thus, both Apple and Power Computing are in negotiations with E4, a small but aggressive startup company, to bundle E4’s CoolDVD MPEG-2 card and software interface with their systems. Although no one from E4, Apple, or Power Computing was willing to comment on when actual products will be available or how much we’ll pay for them, John Chan, E4’s director of product marketing, is clear about his company’s goal: “We want to own the market — and we will.” Given what we’ve seen of the CoolDVD’s elegant interface and impressive performance, he may get his wish.

In addition to MPEG-2 for video, the DVD standard mandates Dolby AC-3 audio for the U.S. and Asian markets; Europe is lumbered with MPEG audio. The Dolby scheme provides 5.1-channel theater-quality surround-sound audio. (That extra tenth of a channel, by the way, is for a subwoofer.) E4’s CoolDVD card will mix this complex audio stream down into a simple stereo signal, or if you’re fortunate enough to have an audio system that will accommodate it, you can plug it into the CoolDVD’s SPDIF optical-fiber audio connector, for surround-sound output.

Software-only MPEG-2 should be possible on the

Mac when Apple ships systems equipped with the TriMedia digital signal processor, as it has announced it will do in mid-1997. CompCore Multimedia, a Wintel developer that plans to provide a software-only MPEG-2 product for Windows systems when Intel releases its multimedia-enhanced MMX microprocessors, says it’s talking with Apple about porting its SoftDVD technology to TriMedia-equipped Macs.

WHO’S ON THE BANDWAGON

So, Apple and Power Computing are in negotiations with E4 and Apple is talking with CompCore Multimedia about future TriMedia-based DVD software. John Cook, Apple’s group manager of Global Strategic Alliances, is heading up the new DVD Program Office, which will coordinate all DVD planning companywide. Bill Goins, Power Computing’s director of product marketing, is calling DVD “a critically important technology” and promising that Power Computing “absolutely plans on pushing the technology envelope.”

So, where does this leave UMAX, Motorola, APS, and DayStar? Simply put, they’re waiting to see what happens. Bruce Berkoff, UMAX’s director of product marketing, promises, “We won’t be the first, but we will be the best” in DVD implementation. Company spokesperson Terri Thorson says that Motorola will get into the DVD business “as soon as Motorola sees enough titles on the market.” DayStar’s David Methven, product manager, says that his high-end, content-creating customers are more interested in creating multimedia content than merely watching it; he predicts that DayStar will focus on CD-R and CD-RW drives until DVD-R and DVD-RAM drives become available in late 1997 or early 1998.

Among the more cautious Mac OS-system vendors, however, it was APS President Paul Mandel who best explained the reasoning behind a wait-and-see approach: “Pioneers get the arrows. Settlers get the land.” / RIK MYSLEWSKI

station, with each embedded copper trace acting as a broadcast antenna. Can you say “massive electromagnetic-interference problems?” How about “FCC?” I knew you could.

Speeding up a data path is not simply a matter of cranking up the clock speed — there are a host of engineering problems that must first be solved, most of them involving internal signal interference. Don’t expect these problems to be solved in the near future — at least not by using technology that’s cheap enough for personal-computer use. For the foreseeable future, the only FM radio on your desktop will be the one tuned to NPR’s nightly business report.

Can you say ‘massive electromagnetic-interference problems?’ How about ‘FCC?’ I knew you could.

A myriad of other bandwidth bottlenecks also keep your Mac OS system’s microprocessor from achieving its full potential — in fact, the situation gets worse the farther you step back from the microprocessor itself. Your system’s connection to storage lingers along at a mere 5 to 10 megabytes per second, its network connection is a meager 10 megabits per second, and even a 28-kbps modem connection to the World

Wide Wait can cause sheer teeth-grinding agony.

But help is on the way in an avalanche of acronyms. High-speed-storage-channel schemes such as SSA, FC-AL, and FC-EL — coupled with net-

IN BRIEF

Copland Wasn’t a Total Bust

DEMOS FOR “APPLE CAFE” cyberbased theme restaurants, scheduled to appear in L.A. later this year, feature a high-tech Internet interface recycled from that ill-fated OS.

Saving the Forest

IF PRINTED SINGLE-SPACED, in a 12-point typeface, a text file that filled a single 4.7-GB DVD disc would require a stack of paper taller than Seattle’s Space Needle. Laid end to end, the pages would reach from San Francisco to the outskirts of Los Angeles.

Be on the Web

WHO SAYS there are no compelling applications for the BeOS? Purity Software (<http://www.purity.com/>) recently announced full-featured Web-server software for that increasingly interesting operating system.

Gil’s Got Guts

WHEN APPLE COMPUTER CEO Gil Amelio reviewed the July ’97 Mac OS release, which includes such Copland refugees as Internet integration and a multithreaded, feature-enhanced Finder, he confided, “I want 100-percent market share, and I grudgingly compromise from there.”

Very Portable Computing

SCIENTISTS AT THE IBM Research Division’s Zurich-based laboratory recently constructed an abacus using single-molecule beads, each with a diameter of less than one millionth of a millimeter.

work topologies such as ATM and 1000BASE-T — will blur the distinctions between storage and networking. Telecommunication protocols such as ADSL, VDSL, and HDSL will speed data over existing phone lines hundreds of times as fast as today’s best modems. Although embryonic, most of these bandwidth breakthroughs are up and running — if not in the Real World, at least under the watchful eyes of ponytailed techies.

The Microprocessor Age is drawing to a close. Oh, those tiny silicon powerhouses will indeed continue to reach ever more dizzying peaks of performance, but their continuing improvement will no longer be the measure of desktop evolution. No, if you want to remain on the cutting MacEdge, keep your eyes on the systems that keep the microprocessor well fed. / RIK MYSLEWSKI

NEW & NOTABLE

Tektronix Phaser 600. Touted to be twice as fast as its liquid-ink competitors, this new solid-ink, large-format printer creates output of up to 34 x 44 inches on any paper stock. \$11,995. Tektronix: 800-835-6100 or 503-682-7377; <http://www.tek.com/>.

Panasonic KXL-783M. Built-in speakers enhanced by Spatializer 3-D circuitry pump up this new portable 8x CD-ROM drive to give your PowerBook surround-sound reproduction. \$499. Panasonic: 800-742-8086 or 201-348-7000; <http://www.panasonic.com/>.

miro miroVIDEO DV 100. High-speed FireWire technology distinguishes this new card, which has easy-to-use editing software included and which captures digital video from FireWire-equipped Sony camcorders directly to your hard disk. \$999. miro: 800-474-6476 or 415-855-0955; <http://www.miro.com/>.

SuperCard 3.0. Allegiant's Roadster Web plug-in, support for embedded links, and new scripting controls make version 3.0 ready for Web authoring — at half the price of 2.5. \$329; upgrade, \$99.95. Allegiant Technologies: 619-587-0500; <http://www.allegiant.com/>.

Presenter 3D. This upgrade to Presenter Professional 3.1, the 3-D modeling, rendering, animation, and directional-sound software, adds tools for creating QuickTime VR movies and supports Apple QuickDraw 3D. \$1,995. Visual Information Development: 818-462-1905; <http://erehwon.caltech.edu/vidi/>.

3D Landscape 2.0. Create walk-through landscapes with a 2,200-plant database and use Shadow Caster, Seasonal Change, and Growth Over Time to predict their evolution. \$60. Books That Work: 800-242-4546 or 415-326-4280; <http://www.btw.com/>.

PictureTalk. This cross-platform client/server conferencing software captures, compresses, and sends screen images to a server for real-time transcontinental or local work sharing. \$100 per concurrent user. PictureTalk: 510-467-5300; <http://www.picturetalk.com/>.

In The Mood. Original brush and ink illustrations of 1940s-style print ads have been digitized for this CD-ROM of cool black-and-white genre clip art. \$229. Havana Street: 800-460-7624 or 512-892-5609; <http://www.eden.com/~havana/>.

NUpowr 1400/200. Boost the hard drive speed and graphics performance of your Apple PowerBook 1400 with this 200-MHz 603ev CPU upgrade, which includes 128K of Level 2 RAM cache. \$675. Newer Technology: 800-678-3726 or 316-943-0222; <http://www.newertech.com/>. / BROOKE C. WHEELER

FIRST LOOKS

NetObjects Fusion

New Web-page-design app on its way.

EVOLUTION ISN'T GRADUAL — current theory holds that it proceeds through sudden leaps. Internet evolution proves this. Web-page design, for example, first emerged as an arcane process that required detailed knowledge of HTML codes. Then products such as Adobe PageMill appeared, making it possible to create Web pages without learning HTML codes and by using an interface reminiscent of a word processor's instead.

The next evolutionary leap is at least as great as the jump from text editors to graphical Web authoring tools. The pioneering product of the next evolutionary leap is Fusion, a Web-page-design and site-management utility from Redwood City, California-based NetObjects. Where PageMill and its competitors made it easier to deal with the limitations of HTML, Fusion lets Web-page creators design pages as freely as if they were using Adobe PageMaker or QuarkXPress.

AFTER-THE-FACT HTML

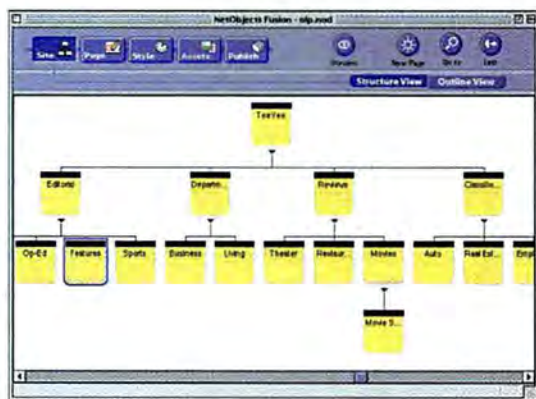

The way PageMill and similar products work is by creating HTML code behind the scenes while you're entering text and importing images. You are, however, still hamstrung by HTML's limitations: If you want to create a complex page design, for example, you must embed text and graphics within tables — a counterintuitive process made only somewhat easier by PageMill and company.

Fusion (\$695) offers a more intuitive approach: You place text on Web pages in text blocks that you can resize at will. Images, likewise, can be placed anywhere on a page and then dragged to whatever locations suit you. Only after you're done designing the page does Fusion take over, calculating the exact HTML code necessary

to make your page render correctly in a Web browser.

At a glance, Fusion looks a lot like a page-layout program: You're presented with a pasteboard, complete with layout grid, and a tool palette. The palette includes tools for the placement and manipulation of text and pictures and the addition of sound, Java applets, Netscape plug-ins, and interactive form elements. All of these items, once placed onto a Fusion page, can be dragged just about anywhere — the only exception being that objects can't overlap, a limitation of HTML that even Fusion can't get around.

Being able to place text and graphics anywhere on a page makes Fusion feel unlike any other HTML editor. However, the beta version of Fusion we tested still bears some scars that may relate to its transition from Windows 95 to the Mac OS. Buttons on the tool palette became unselected

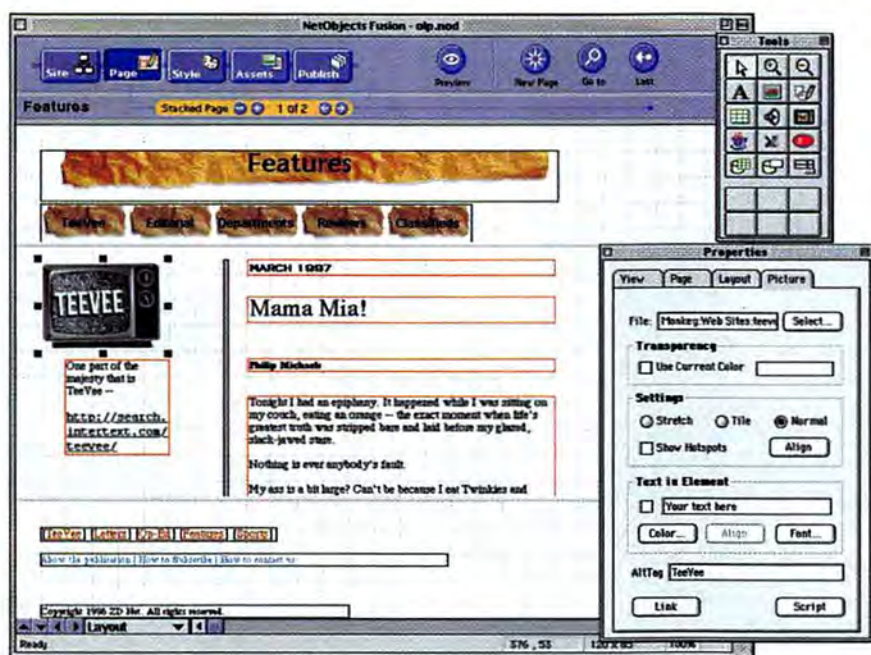

In addition to offering page-design features, Fusion also helps manage your entire Web site by letting you make page-link changes on an easily modifiable site map.

without warning, attempts to move an entire text block inexplicably placed us in text-editing mode, and closing a site window automatically quit the entire application. In addition, Fusion doesn't support standard Mac conventions for editing text: We could make text bold or italic or adjust text alignment only by clicking on a floating palette — no keyboard commands worked. We hope NetObjects fixes these shortcomings before its final release.

SITE UNSEEN

Fusion not only offers a much improved way to design Web pages but it's also a powerful tool for

PROS: Gives designers page-layout design freedom. Excellent site-management and navigation features.
CONS: Interface quirks hinder usability. Lack of keyboard shortcuts. Fails to anti-alias button text.
INFO: \$695. NetObjects: 888-482-3200 or 415-943-4048; <http://www.netobjects.com/>.

NetObjects Fusion provides new Web-page design freedom by allowing free movement of text blocks and images on a gridded pasteboard. Fusion also automatically generates navigational buttons and the HTML code they require.

creating entire Web sites. A tool bar at the top of Fusion's window (it has only one window — another vestige of its Windows 95 roots...) lets you step through all the stages of site management, from organizing your site to editing individual pages to, in the end, uploading your site to a Web server.

Fusion's site view lets you organize your Web

site's component pages via a tree metaphor. You can drag and drop pages from place to place on the tree. The program also can automatically generate running navigational headers and footers for every page of your site by using built-in site styles. (Although Fusion's implementation of style sheets is internal to Fusion and is not compatible with the new Cascading Style Sheets HTML feature, the

HTML code generated is compatible with all common Web browsers.)

Each site style can include a banner graphic, a navigational-button style, a default background pattern, and even default text colors. Fusion will ship with 50 already designed site styles.

Once you've selected a site style (or created one of your own), Fusion can automatically generate navigational text and place it on the site's banner graphic and navigational buttons. The program automatically overlays text and generates custom GIFs for every button and banner — creating a site that looks custom-built but saving the Webmaster hours of text and GIF editing in Photoshop. However, we were disappointed that Fusion didn't anti-alias the text it generates, in order to reduce jaggedness on navigation buttons.

Once your site has been created (or updated), Fusion can automatically upload all the files in your site to your Web server via FTP. After setting up your server name, log-in name, and password, uploading a site to a temporary staging area for testing or to your final production server requires only a single button click.

NetObjects Fusion has the potential to change the way Web pages are designed and Web sites built — but it's not without its limitations. Any designer with experience in PageMaker or QuarkXPress will be both delighted by Fusion's improvements on PageMill and appalled at some of Fusion's interface clunkiness. Fusion may indeed deserve to be called the Next Big Thing in online publishing — but it's also truly a version 1.0 product. It'll have to shake out quite a few glitches before it can fulfill its potential. / JASON SNELL

Whistle InterJet 100

One-stop Web-server shopping.

HALF THE BATTLE of getting your office onto the Internet is assembling the hardware, software, and service you'll need. You've got to find and configure each piece and make sure it works with the others you've acquired. Whistle Communications' first product, the InterJet 100, comes as close as anything we've seen to making one-stop Internet shopping a reality.

The InterJet 100 is a compact, well-designed all-in-one hardware/software package that takes the pain — and the risk — out of setting up your own Internet server. Although the beta unit we tested was incomplete, the concept and Whistle's implementation are promising.

The InterJet 100 is about the size of a bread box

and contains a UNIX-based computer and hard drive. There's also an IP router, a 33.6-kbps modem, and a four-port Ethernet hub — all stuffed into the same bread box. Once you've purchased an account from one of the service providers that Whistle has signed up, the InterJet can dial your provider and configure itself automatically for your network.

From your Web browser, you can create user accounts, establish public and private Web sites, and keep an eye on the server's status. The interface is smooth and easy to work with, although the little guy you'll find on Whistle's configuration pages is a bit, well, too cute.

Speed and flexibility are the InterJet's two cur-

rent limiting factors: The first release will ship with a built-in 33.6-kbps modem; Whistle says ISDN will come later in 1997. Since its internal operating system is pretty well masked from even the system administrator, the InterJet is not the best choice for would-be Webmasters who want to run Mac CGI applications (that serve databases for example). You're limited to serving HTML and graphics files.

At \$1,995, the Whistle InterJet 100 should be an attractive choice for small businesses with limited experience or interest in configuring Internet access and servers and whose access needs are basic. / SHELLY BRISBIN

PROS: Well-integrated hardware. Attractive, easy-to-use Web interface.

CONS: Available only from select ISPs.

No ISDN support. No SCSI support.

INFO: \$1,995. Whistle Communications: 415-577-7000; <http://www.whistle.com/>.

Is it Art Yet?

The creative process has always been a mystery to some. To others, it's a way of life. For them, we offer the S900. A computer designed specifically to meet the needs of the creative professional. The S900's advanced architecture combines high performance and expandability with the familiarity of the MacOS . With worry-free service (*standard 3 day on-site warranty*) and at a price that can't be beat, the S900 is setting new standards for an old pursuit: **Art.**

SUPERmac®

Computers that Work the Way You Do.

S900 KEY FEATURES

1

Standard Interleaved Memory

Every S900 comes standard with interleaved memory for workstation-quality 128-bit access memory and best system performance. Others only provide 64-bit access memory.

2

Advanced Scalable Processor Design (A.S.P.D.) This modular configuration allows easy upgradeability to add or change CPUs as desired. Costs less and is more flexible, allowing your system to grow as you do.

3

UMAX PCI-to-PCI Bridge

The S900 allows burst communication between all PCI slots, no matter where devices are inserted, for greater expandability and easy set up.

- Ultimate Expandability
- Totally Upgradeable
- Advanced Design

FIRST LOOKS

SyQuest SyJet

New removable drive jets past Jaz.

SATCHELL PAIGE ONCE WARNED, "Don't look back. Something might be gaining on you." Iomega, maker of the de facto 1-GB removable-cartridge standard, the Jaz drive, would do well to heed his advice and to move full-speed-ahead with whatever follow-on product it may have waiting in the wings: The Jaz drive's current dominance is about to be challenged, big-time, by SyQuest's long-awaited SyJet removable-cartridge drive.

Although the SyJet (\$499) and the Jaz are priced essentially the same — as are their cartridges — the SyJet's cartridges hold up to 1.4 GB (depending on the formatting method), compared to the Jaz cartridges' 1 GB. Unlike the Jaz drive, the SyJet has a door that closes behind the cartridge, protecting it, according to SyQuest engineers, from dust and other contaminants. Although this may be a good idea in theory, the door mechanism in our preproduction model didn't open fully, an annoyance that a SyQuest spokesperson promised would be fixed in final versions.

But speed is the heart of the battle, and even a preproduction SyJet has an impressive performance edge over a shipping Jaz. For example, the MacBench 4.0 Publishing Disk test, which mimics the exact drive-access operations used by Photoshop and QuarkXPress in real-world operations, shows the SyJet to have a significant speed advantage over the Jaz: It was nearly half-again as fast.

On the MacBench Disk test, which mimics the combined operations of Microsoft Word and Ex-

cel and nine other popular productivity applications, the SyJet runs neck and neck with the Jaz. In fact, the only tests in which the Jaz has a significant edge over the SyJet are those that mimic reading — but not writing — small blocks of data, the types of blocks that comprise Word files. Clearly, the SyJet is being groomed not for the small-file world of the office but for the large-file environment of desktop-publishing professionals, graphic artists, and video editors.

Overall, the SyJet drive put in an impressive performance. What's more, our test unit had an onboard cache of only 256K — half the 512K cache planned for the shipping version. SyQuest engineers plan to continue refining the SyJet's cache algorithms after the SyJet ships and to make upgrades available for downloading from the SyQuest Web site. Since the SyJet is equipped with flash ROM, upgrading its cache algorithms should be easy. If SyQuest engineers make good on their promise, the SyJet may actually get faster, the longer you use it. /RIK MYSLAWSKI

PROS: Faster in publishing tasks than its main competition, the Iomega Jaz.

CONS: Mediocre performance when reading small-block files.

INFO: \$499. SyQuest: 800-245-2278 or 510-226-4000; <http://www.syquest.com/>.

Adobe Type Manager

"SUITCASE KILLER" is the first phrase that comes to mind when you see Adobe Type Manager Deluxe 4.0 and its companion utility, Adobe Type Reunion 2.0, at work. Our first look at beta versions of these font utilities showed them to be more than just major upgrades to the familiar Adobe type-management applications — their powerful font-handling and menu-customizing capabilities may well prove to be a two-fisted knockout punch to such popular utilities as Symantec's Suitcase 3.0 and Alsoft's MasterJuggler Pro 2.0.

Adobe Type Manager Deluxe (\$49.95) upgrades the old ATM's font-rasterizing and -substitution features and then adds the font-set-creation capabilities of Suitcase and the diagnostic features of MasterJuggler Pro. Like those utilities, ATM Deluxe lets you remove Type 1 and TrueType fonts from your beleaguered System Folder and organize them, by name or by project, into sets that you can open or close with ease. But ATM Deluxe goes further, by automatically activating fonts when you open a document that requires them. (You can keep the fonts open or make them close when the application does.) Also new is the power to edit

multiple-master typefaces from within the ATM Deluxe control panel.

Creating sets isn't completely intuitive — we ended up with two sets of everything when we tried to automate the process with the Add All command. Another wrinkle was that we couldn't get our beta version to automatically convert Suitcase sets — although Adobe promises that the final version will.

ATM Deluxe can also diagnose and work around many font failings. When you "verify" your fonts, those with serious problems are marked in red and ATM Deluxe will not let you use them. ATM Deluxe will also notify you of minor problems and try to work around them until they're fixed — for example, by creating a substitute for a missing PostScript file.

Another font foible that utilities have addressed is long, unwieldy, and cryptic font menus. Adobe Type Reunion (\$60; bundled with ATM Deluxe, \$69.95) comes to the rescue with unprecedented control over what those menus will look like. You can open and close ATM Deluxe sets from your font menu; you can choose which, if any, fonts will dis-

play WYSIWYG in the menu; you can customize the menu to show only the fonts you're using in a project; and you can use the menu to aid in design decisions — for example, by creating a tidy folder to hold display faces.

What you won't find in the Manager/Reunion bundle are some extras that come with other utilities. For example, neither ATM Deluxe nor ATR supports AppleScript; Suitcase not only supports it but also tells you how AppleScript can automate font tasks such as creating sets from font folders on project disks. ATM can't compress fonts; both Suitcase and MasterJuggler Pro can compress TrueType and screen fonts to minimize the hard-disk space they use. And ATM Deluxe can't gather up project font files for service bureaus, as MasterJuggler Pro can.

Although they lack some niceties, Adobe Type Manager Deluxe 4.0 and Adobe Type Reunion 2.0 may finally take the pain out of type management.

/SCHOLLE SAWYER

PROS: Powerful control over font sets.

CONS: No font-compression features or font-gathering capabilities.

INFO: \$49.95, ATM 4.0, \$60, ATR 2.0 (\$69.95 bundle). Adobe Systems: 800-445-8787 or 403-262-8008; <http://www.adobe.com/>.

New OmniPage Pro 7.0 gives you the recognition you deserve.

OmniPage Limited Edition or OmniPage Lite is the OCR that came with your scanner. They give you basic OCR.

How to Improve Your OCR Accuracy and Save Big \$\$\$

Caere Corporation (NASDAQ: CAER) recently announced an upgrade that makes the OmniPage Pro upgrade (OmniPage Pro 7.0) a major software reseller for an estimated street price of only \$129. This is an inexpensive way for scanner users to step up to fully-featured OCR products (including those bundled with flatbed and other types of products) can upgrade to the full version of OmniPage Pro at a \$329.

OmniPage Pro has a separate upgrade package available through Computer City, Egghead, and Best Buy. Since the vast majority of Caere OCR, most scanner users are eligible to upgrade at this price.

The large number of scanner manufacturers that bundle Caere OCR (Microtek, Canon, Phasetek, Umax, Nikon, Agfa, Logitech, Rollei) are eligible for the upgrade.

The upgrade program includes OmniPage Pro 6.0 (Windows 3.1 and 7.0/Windows 95), which offer all the capabilities of the bundled version for extended functionality. Most notable among them are high-resolution "zoning" and preprocessing of scanned images, verification of the Page technology for the retention of the original page formatting, as well as OCR training and deferred processing capabilities.

The Changing OCR Market: In the not so distant past, OCR required more time and OCR software that was often difficult to use and provided less than satisfactory results. These issues were frustrating and limited the use of OCR to high-volume vertical markets. The use of desktop OCR was limited to the "early adopters."

"Today, several trends are contributing to the widespread use of OCR," said Chad Kinzelberg, Caere's vice president of product development. "The program is another major factor that will promote the use of OCR. As an occasional OCR user will find Caere software more attractive because of its ease of use and cost."

Analysts following the OCR market agree that OCR use is on the rise and industry trends promoting its mainstream adoption:

Higher Customer Awareness: An increased number of computer users are becoming more aware of the time and money saving benefits it provides.

Higher Scanner Penetration: Scanners prices have dropped drastically in many flatbed grayscale scanners available for under \$500. Also, attention (such as the small-footprint sheet-fed scanners) and multifunction devices have entered the market.

Increased OCR Accuracy: OCR developers have developed high-accuracy OCR technology for increased output. The greatest improvement has been made on degraded and hard to read documents.

Improve Your OCR and Save Big \$\$\$

Higher Scanner Penetration:

Scanners prices have dropped dramatically in the last few years with many flatbed grayscale scanners available for under \$500. Also, attention (such as the small-footprint sheet-fed scanners) and multifunction devices have entered the market.

CR Market:

Just, OCR required more time and OCR software that was often difficult to use and provided less than satisfactory results. These issues were frustrating and limited the use of OCR to high-volume vertical markets. The use of desktop OCR was limited to the "early adopters."

Low cost scanners entering the market have helped push OCR use to a new level.

Increased OCR Accuracy:

OCR developers have developed high-accuracy OCR technology for increased output. The greatest improvement has been made on degraded and hard to read documents.

Pricing and Availability:

OmniPage Pro 7.0 (Windows and Mac) and WordScan Plus 4.0 (Windows) upgrade packages are immediately available at major resellers for an estimated street price of \$129.

The Company:

Caere Corporation, with U.S. headquarters in Los Gatos, Calif. and European headquarters, Caere GmbH, in Munich, Germany, is a leader in OCR technology and desktop document management products. Caere has recently expanded its product line of OCR products.

OmniPage Pro gives you almost twice the OCR accuracy with the same ease-of-use as OmniPage Limited Edition.

OmniPage Pro keeps text in its original format and layout, including graphics.

OmniPage Pro even outputs to HTML.

OmniPage Limited Edition

OmniPage Pro

Upgrade now to faster, more accurate OCR.

Sure, the OmniPage Limited Edition OCR that came with your scanner is good. In fact, that's why scanner makers like HP, Microtek and Agfa chose it above all others.

But if you want greater accuracy, full-throttle speed and a ton of new time-saving features, then it's time you moved up to OmniPage Pro®.

OmniPage Pro employs a new, more powerful OCR engine to recognize poor copies and degraded faxes.

It integrates seamlessly with your favorite applications like Word, ClarisWorks and more. It even guides you through the OCR process using its AutoOCR Toolbar. All with the simple push of a button.

What's more, you get the advantages of the world's most popular OCR software without learning an entirely new program. So make sure you're getting all the OCR power and accuracy you deserve. Call now to upgrade, or visit a local reseller.

REVIEWS

Adobe Photoshop 4.0

Image-editing stalwart gets subtle overhaul.

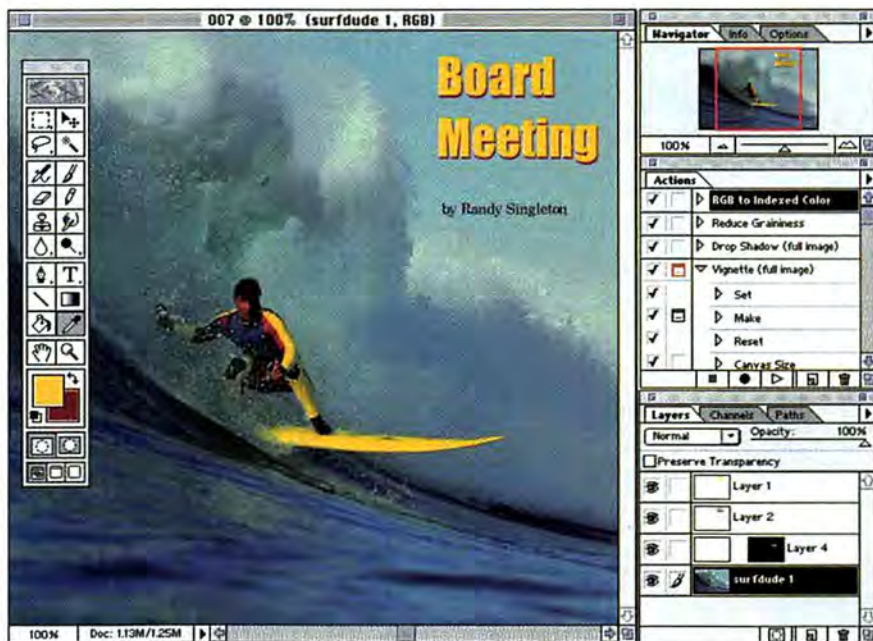

MICROSOFT MAY RULE the business world, with its combination of programs and operating systems, but the computer-graphics world is dominated by a single application. Whether for photography, illustration, fine art, animation, or online development, Adobe Photoshop has long been the program of choice, thanks to its power and its masterful interface.

With this latest release, Adobe has refined the program even more, adding such niceties as batch processing and nondestructive adjustment layers. At first glance, Photoshop 4.0 does not appear to be overflowing with new features or radical changes, but as you use it, you'll find many well-designed, tightly integrated improvements.

Select Features

Photoshop's system requirements have hardly changed. This version demands a megabyte more of hard-disk space than version 3 (or about 10 MB) and a minimum of 10 MB of RAM. Interface changes, on the other hand, are apparent from the moment you launch the program: Palettes, dialog boxes, and buttons have been recrafted, with a slight three-dimensional appearance; menus have been reworked; and the primary toolbox has been reorganized (see the "Familiar, Yet Different" figure).

Although we believe that the changes Adobe has made to the Photoshop interface are all useful improvements, we nevertheless found them somewhat disorienting at first. The crop tool, for instance, has been relocated from its spot in the toolbox's top tier to the marquee tool's new pop-up menu. That repositioning

Photoshop 4.0's complement of tools includes the new Actions and Navigator palettes, a revamped main toolbox, and an enhanced Layers palette.

has made room in the toolbox for the indispensable Bézier-path tools, which were relegated to the Paths palette in version 3 of Photoshop.

You Gotta Move

Also new to the toolbox is a revamped move tool. The move tool is the *only* tool you can use to move the contents of a selection in Photoshop 4.0. This differs from earlier versions of Photoshop, in which you used selection tools (the marquee, lasso, magic wand, and pen) both to define portions of an image and to move them. In Photoshop 4.0, clicking within a selection moves the selection boundary rather than the selected pixels. (You can invoke the tool at any time simply by pressing Command-Option.)

Although this will seem strange to experienced users at first, the move tool makes it possible to control selection paths independently of their content. Selection outlines can be moved between layers of a document or even

dragged and dropped from one file onto another, which is great for making selections of identical shapes in different images.

Photoshop 4.0 provides more-powerful collage and compositing features than previous versions. As in version 3, you can use the move tool to reposition a selected layer within your canvas. But in version 4.0, you can hold down the Control key to see a pop-up menu of all layers currently below the move tool. Within that menu, you can quickly choose which layer you want to move. To further aid compositing, Photoshop no longer crops pixels that fall outside the canvas.

Layers of Improvement

Although the program's layer support was nothing to complain about in version 3, Photoshop 4.0 generally uses layers more intelligently. For example, when you drag and drop or paste selections into a document, the program automatically creates a new layer rather than a floating

★★★★	VERY GOOD
★★★	ACCEPTABLE
★★	POOR
★	SERIOUSLY FLAWED
●	DANGEROUS

selection, which unobtrusively keeps your document organized. And although this method can lead to layer pile-ups, improved merge tools make consolidation easy.

Other layer refinements include the versatile Free Transform command, which places handles around the boundary of a layer so you can scale, rotate, or shear it, either by dragging the handles or by entering numerical values in a dialog box. And, at last, individual layers can be flipped and transformed. These features are organized in the changed Layers palette, which makes it much easier for you to tell which functions affect layers and which affect the whole document.

In a helpful improvement to the powerful layer-mask feature, you can now specify whether a mask should initially hide or reveal its associated layer. You can also create a layer mask from the current selection.

Painting Your Changes

One of Photoshop's most powerful new features is the addition of adjustment layers, which let you perform nondestructive, modifiable edits. Using them, you can perform tonal adjustments and some special effects on entire layers or selectively, using brush tools, without altering your original image data. This way, you can quickly and easily try many different edits without sacrificing your original image.

Nine types of adjustment layers are available, including Curves, Levels, Hue Adjustment, and Posterize. After you've selected a layer type, the standard dialog box for the chosen effect appears. Effects applied via an adjustment layer affect only layers below that layer — unless you confine its effect to a single layer. Like any other type of layer, an adjustment layer can be hidden or deleted at any time, restoring all affected layers to their original state.

By default, an adjustment-layer effect is applied uniformly over the whole image. However, by painting in an adjustment layer with brush tools, you can apply the chosen effect in varying amounts to any part of your image. So, for example, by painting in a color-correction adjustment layer, you can apply varying amounts of correction to different portions of your image. This approach is a vast improvement over that of Photoshop 3, which required you to create a separate mask for each color adjustment.

For the operations they support, adjustment layers provide a form of nonlinear,

ADJUSTMENT LAYERS ADD PRECISE CONTROLS

THIS COMPOSITE IMAGE DEMONSTRATES how an adjustment layer is used in Photoshop 4.0 to selectively apply an effect to certain layers without affecting the others. As reflected in the Layers palette (top right), the Invert filter has been applied to a rectangular area in the second layer of the image. The filter affects only those layers beneath it — the spider image and the checkerboard background. The type layer above the adjustment layer is unaffected, as shown in the final image (top left).

Type layer

Spider

Adjustment layer (Invert)

Image layer

Background layer

unlimited undo. Because you can always remove an adjustment layer, you don't have to worry about saving multiple versions of a document. We're still waiting for a *real* undo tool, but this is a step in the right direction. We'd also like to see adjustment layers capable of more operations, most notably Gaussian Blur and Unsharp Mask.

Taking Action

Like version 3's Commands palette, Photoshop 4.0's Actions palette allows you to specify functions that can be triggered by a mouse click or a press of a function key. But actions go far beyond version 3's one-step commands. The Actions palette enables you to create

scripts of multiple actions that can be played back on any image at any time. A set of simple VCR-like controls at the bottom of the palette allows you to record and play back action sequences.

To provide variable control, you can set a breakpoint next to any item within an action. This tells Photoshop to pause and wait for user input, affording you the opportunity, for example, to adjust the settings for a particular operation.

The Actions palette contains the simple yet powerful Batch command, which you can use for applying an action script to a batch of images.

Photoshop has needed action features for

a long time, but although version 4.0's implementation is good, it still has a few problems. Not every feature is scriptable. Most notably absent is the ability to script the change of a layer's transfer mode.

Also, batch processing of scripts that create or delete layers is impractical, because, like version 3, version 4.0 requires you to enter a filename when you save any document to which layers have been added or from which they've been removed. A final frustration: Photoshop 4.0 cannot read Photoshop 3's Commands settings, so you'll have to rebuild them if you want to use them in the new version.

AppleScript support, albeit limited, is another boon for automated processing in Photoshop 4.0. In addition to the required suite (Open, Print, Quit, and Run), this version of Photoshop provides just one scriptable command, Do Script, which lets an external application trigger a Photoshop action.

Snappy Grids

New in version 4.0 are a few utilitarian features that aid workflow. As in a drawing or CAD program, you can display nonprintable grids and guides in your Photoshop image. With snapping turned on, layers and selections automatically snap to the nearest grid line, greatly simplifying the alignment of multiple layers (although we'd still like to see an Illustrator-like Align command).

In a welcome change, the program no longer limits zooms to factors of 2: You can randomly zoom by typing any zoom percentage (to two decimal places) into the zoom box in the lower left corner of a document window. To further aid zooming, the View menu includes new automatic zoom-level commands such as Fit on Screen, Actual Pixels, and Print Size.

Zooming can also be controlled from the new Navigator palette. Displaying a small thumbnail of your document, this palette

includes a slider for variable-zoom control as well as a draggable selection marquee for interactively panning about in your document. At first glance, the Navigator palette may seem little better than scroll bars. But having zooming and panning so elegantly integrated into a single, simple control is a luxury — especially for high-resolution images displayed at high magnification.

Photoshop's gradient tool has been completely redesigned and functions much more like the full-featured gradient controls that are available in high-end drawing packages. Where Photoshop 3 simply created a linear or radial gradient between the foreground and background colors, Photoshop 4.0 allows you to create and store multicolored gradients with varying levels of opacity. For example, you can have a gradient that fades from completely opaque blue to 50 percent opaque red.

World Wide What?

Like nearly everyone else in the Western Hemisphere, Adobe has been thinking about the World Wide Web. In addition to the button at the top of the tool palette that automatically takes you to Adobe's Web site, Photoshop 4.0 has several features to ease the development of graphics for the Web.

Photoshop now ships with the GIF89a export filter, which lets you save indexed-color images as GIF or interlaced-GIF files. In addition, the filter enables you to view an image's color palette and specify which colors are transparent. The Indexed Color Mode Change dialog box allows you to select Web as a palette option for remapping an image to the 216 colors common to Mac OS and Windows Web browsers.

Version 4.0 also supports Macintosh Drag and Drop from Photoshop to PageMill 2, Adobe's WYSIWYG Web-page-creation tool. Despite these useful features, Photoshop could be a little more Web-aware. In particular, we would like to see the ability to attach URLs to individual layers (à la Fractal Painter 4), to facilitate automatic image-map generation.

Generally Faster, but Not Always

Although most of the changes in Photoshop 4.0 aim to make design and production easier for users, Adobe also spent some time attempting to boost Photoshop's speed. On the whole, Photoshop 4.0 is not dramatically faster than version 3, but it definitely feels a little bit peppier at a variety of routine tasks. Files don't open any faster, but we noticed a

FAMILIAR, YET DIFFERENT / Photoshop's new toolbox

ASIDE FROM THE 3-D LOOK, the helpful changes to the Photoshop toolbox in version 4.0 are hard to spot at first glance. At left is the new toolbox, which now includes pop-up tool menus; at right are the changed tools, with a brief description of what's new.

Web Link: If you're connected to the Internet, clicking here opens your browser to the Photoshop 4.0 home page.

Move: Now the only Photoshop tool for repositioning pixels in an image.

Marquee: Options, which now include the crop tool, are displayed via a pop-up menu.

Lasso: A new pop-up polygon tool constrains selection segments to straight lines.

Pen: A toolbox addition furnishes Bézier-selection tools formerly consigned to the Options palette.

Blur: Now furnishes the sharpen tool as a pop-up option.

Dodge: Burn and sponge tools are now available via a pop-up menu.

Type: Now places filled bitmap type on a new layer; the pop-up type-mask tool creates type-outline selections.

D I A M O N D P R O 9 1 T X M

The DIAMONDTRON advantage is now even bigger, sharper and clearer.

Introducing the world's first .28mm, 21-inch (19.7" DVI*) aperture grille monitor.

The new Diamond Pro 91TXM (21" CRT/19.7" diagonal viewable image) from Mitsubishi Electronics represents an unprecedented improvement in the way you'll look at monitors from this moment on.

Bright, vivid colors with superb contrast. Razor-sharp focus due to Mitsubishi's enhanced electron gun. High refresh rate for flicker-free imagery. On-Screen Display system with intuitive front-panel controls. All in an ergonomic, compact enclosure that fits easily into any workspace.

Best of all, the Diamond Pro 91TXM is available at the estimated selling price of \$1,699, including a comprehensive 3-year warranty and support program to keep it working at peak efficiency. The new Diamond Pro 87TXM (17" CRT/16.0" diagonal viewable image) is also available, with an estimated selling price of \$849.

Get all the details today—both on-screen and off—by calling Mitsubishi Electronics at **1-800-843-2515** in the U.S. and Mexico. In Canada call **1-800-387-9630**. For immediate product specifications call Mitsubishi Qwikfax at **1-800-937-2094**. World Wide Web <http://www.mitsubishi-display.com>

CIRCLE 86 ON READER SERVICE CARD

speed improvement of 20 to 30 percent on mode changes (from RGB to CMYK) and when applying the Gaussian Blur and Unsharp Mask filters.

Another routine operation that's faster in Photoshop 4.0 is screen redraw. The amount of time it takes for an image to fill in after you've closed a dialog box or when you bring

a hidden image window to the foreground is noticeably lessened. The reason for this speed-up is a new under-the-hood feature called the Image Cache. This cache, which stores low-resolution versions of high-res images for use in updating the screen, is user-adjustable: You can set its level from 1 to 8; at the default setting of 4, redraw is appreciably speedier.

ADJUSTING YOUR PALETTE / navigating new controls

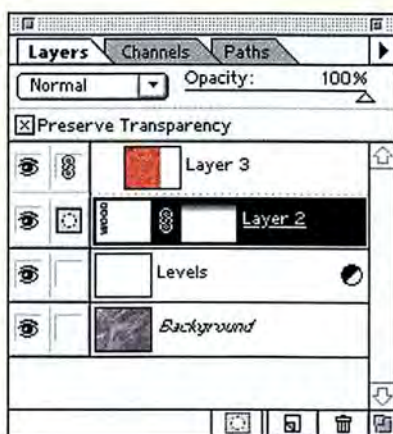

USERS OF EARLIER VERSIONS of Photoshop will find a couple of helpful new tool palettes in version 4.0 and significant enhancements to the Layers palette, which debuted with version 3.0. Here's the lowdown on the new stuff:

The Navigator palette provides a zoom slider and a thumbnail of your image with an inset that indicates the portion you're currently working on. Zooming or repositioning the inset frame changes the contents of your image window correspondingly. This saves much scrolling, especially with high-resolution images.

The Actions palette provides Photoshop with some long overdue automation. It lets you record command sequences for reuse and can even be used for batch-processing the contents of a folder. You can skip steps in a sequence by unchecking the boxes at left; the dialog-box icons in the second column denote commands that prompt you for input (of pixel dimensions, for example).

The Layers palette now provides a button for creating layer masks (bottom left) and better visual feedback on layers that are linked or are part of a clipping group.

There is one operation, however, in which Photoshop 4.0 is actually *slower* than its predecessor: rotating objects. There are two ways in which you can rotate things in Photoshop 4.0: You can use the new Transform functions to rotate a layer, or you can use the new Rotate Canvas command (which replaces the Rotate commands found on Photoshop 3's Image menu).

Surprisingly, however, both of Photoshop's rotate features are noticeably slower than rotating in Photoshop 3. (Rotating using Photoshop 4.0's numeric Transform, in particular, is glacially slow.) This is a concern if you do a lot of collaging and layout work in Photoshop.

As with version 3, running the program on a multiprocessing machine is significantly faster than running it on a single-processor machine. We tested Photoshop 4.0 on a Day-Star Genesis 720 (with four 180-MHz PowerPC 604e chips) and discovered that almost every one of Photoshop's operations was accelerated markedly.

Documentation and Support

As usual, Adobe's documentation is well written and organized and beautiful to look at. Version 4.0's, however, seems a little skimpier than that of previous versions. Although the single 400-page user guide contains some tutorial information, Adobe no longer ships a printed tutorial. Rather, it provides a hybrid Mac/Windows CD-ROM that contains a few QuickTime movies and a lot of Acrobat files of tutorial information.

Conspiracy theorists in our midst suspect that this is an Adobe ploy either to make you use a PostScript printer for printing the PDF files or to get you to spring for an expensive Adobe Classroom in a Book.

The Bottom Line

The latest version of Photoshop delivers a few significant new features, such as adjustment layers, which let you "paint" certain effects onto select areas of an image, and batch processing. But most changes in version 4.0 are subtle, extremely thoughtful refinements that make the program more useful and responsive. Except for an annoying reduction in rotation speed, Photoshop 4.0 is a great upgrade. / Ben Long

FreeHand 7

A new champion emerges among Mac drawing programs.

FREEHAND 7, the latest version of Macromedia's venerable drawing program, combines a handful of groundbreaking innovations with improvements derived from cherry-picking the best features of competing programs. By combining these with a thoughtful interface overhaul, Macromedia has made FreeHand the reigning champion of the crowded drawing-package field.

Chief among FreeHand 7's breakthroughs is its innovative feature for finding and replacing graphics. This stunningly versatile tool lets you instantly change colors, stroke widths, scale, rotation, fonts, and path shapes. You can, for example, instantly double the stroke weight of every 1.5-point path, so your technical drawing will reproduce better on an old copy machine. You can even replace instances of one object with another.

Another all-new feature in FreeHand 7 includes support for Shockwave, Macromedia's technology for displaying zoomable graphics with scalable, anti-aliased type on the World Wide Web. FreeHand files can be converted to Shockwave objects via an Xtra plug-in module, although this process is given only passing mention in the FreeHand manual.

Web publishers will also appreciate new Xtras that allow you to attach URLs to images (or portions of images) and that let you import and export files in the Web-standard GIF and JPEG formats and even in Adobe Systems' Web-ready PDF (Portable Document Format).

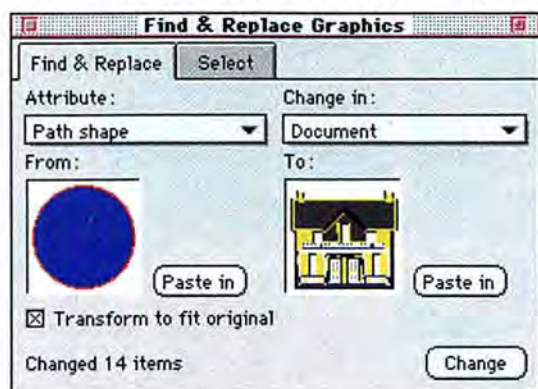

Interface Improvements

FreeHand 7 has a new interface convention designed to unify the look and feel of Macromedia's content-creation programs. But even if you don't use Director, Extreme 3D, or xRes, you'll appreciate useful improvements such as the addition of a text tool bar, with standard type-size and -spacing controls, to FreeHand's main work window. We particularly liked the new tabbed, tear-off tool palettes: It's great to be able to tear off sections of the Inspector — the palette that reports on certain attributes of objects in your document — so you can, for example, view an object's stroke and fill types simultaneously.

Something Borrowed

Veterans of other drawing packages may get a sense of déjà vu upon seeing several FreeHand 7 improvements. There are shades of Adobe Illustrator in an expanded set of special effects and a tighter integration with Adobe Photoshop, of Deneba's Canvas in FreeHand's improved blends, of CorelDraw in the revamped color autotracer, and of all three rivals in a fuller complement of export formats.

FreeHand's overhauled autotrace tool transforms bitmaps — photos, technical schematics, artwork — into editable vector-based art, now in up to 256 colors. Customization options include outline, centerline, and outer-edge tracing, as well as a setting for low, normal, and high levels of accuracy. (The

FreeHand 7's powerful Find & Replace Graphics feature automatically substitutes one graphic for another throughout your document.

Outer Edge tracing option, incidentally, provides a sorely needed workaround for FreeHand's continuing inability to automatically create clipping paths around rasterized objects.)

Using the highest level of accuracy to trace a digitized color photo, we achieved excellent results. Such top-quality results are only for the RAM-rich, though. Even with an allocation of 20 MB of physical RAM, FreeHand was able to trace an 825-x-800-pixel color photo only at the lowest quality level. (Virtual memory was no help; it made the Mac crawl unbearably.)

Designers of on-screen and print graphics alike will like FreeHand's tighter integration with other applications. You can now drag and drop objects between FreeHand and any application that supports Apple's Drag Manager, such as Photoshop. Photoshop artwork retains its original resolution when you drag it into FreeHand, but irregularly shaped Photoshop objects expand to rectangles. This latter behavior is annoying, but FreeHand still handles

Photoshop objects better than Adobe's own drawing program: Images dragged into Illustrator keep their shape but convert to a disappointing 72 dpi.

To further aid bitmap editing, FreeHand 7 lets you designate Photoshop or another program to be your bitmap editor of choice, so when you double-click on a TIFF within FreeHand, that editor will launch.

Less Bland Blends

Substantially improved, FreeHand's blending tool — which transforms one shape into another over a series of interpolated steps — is nonetheless not quite state-of-the-art. You can now blend shapes and colors among multiple objects, rather than just between two, as before.

And FreeHand now matches its competitors' ability to bind a blend to a path and to blend spot colors and gradients. But unlike Canvas 5, FreeHand won't let you alter any of the interpolated shapes within a blend.

Effective Effects

FreeHand 7 offers some nifty new special effects that increase your design options. You can now wrap an envelope around an object and then pull on the envelope handles to distort the object. You can apply the Roughen effect to your

artwork to give it a hand-drawn look. And you can drag the new bend tool over a polygon, to make it appear bloated or pinched.

FreeHand's feature set is quite comprehensive, but there are still some items on our wish list. The ability to see PostScript-language fills and paths on-screen. A full-featured path pattern editor. An eyedropper tool that samples any on-screen color, in any open application or on the desktop. Still, compared to the competition's, FreeHand's shortcomings are few.

The Bottom Line

FreeHand offers the best collection of drawing features on the market today; spring for an extra \$50, and get the FreeHand Graphics Studio 7, a truly terrific value that includes Extreme 3D, Fontographer, and xRes along with FreeHand 7. / Shelley Cryan

The new Mac OS 7.6. Now, wherever your mind goes your computer will follow even faster.

Enhance your performance on your Mac OS computer.

The job of a great operating system is to get out of the way. To let you fashion ideas, unencumbered by process. Nothing does that job better than Mac® OS 7.6. It not only raises 'intuitive' to new and exciting heights, it's also a major advance in the ease with which powerful new functions can be deployed on your desktop.

Now you can bring live web pages into your OpenDoc compatible documents and have them automatically updated. New virtual memory management allows you to launch your applications up to 40% faster, and your "Print" commands will execute up to 35% faster.* And you

can open PC files (including Windows 95 files) without the applications in which they were created. Mac OS 7.6 also makes the installation of an operating system simpler than it has ever been: in just a few steps you'll have access to QuickTime® applications, Apple® Open Transport, the OpenDoc® program, Cyberdog™ software* . . . all the latest advances from Apple.

Enrich your ideas by enhancing your computer. Buy the pleasingly affordable Mac OS 7.6 at your local Apple software reseller or call 1-800-482-6376 ext. 1421. For more information, visit us on the web at www.apple.com.

Adobe Persuasion 4.0

Impressive upgrade links presentations to the Web.

ADOBE SYSTEMS' MASTER PLAN to meld its line of products into a well-coordinated, unified team is right on schedule with Adobe Persuasion 4.0. The latest version of the company's popular presentation program coordinates especially well with Adobe's graphics programs, Illustrator and Photoshop, and it links just as seamlessly to the World Wide Web.

Like most other presentation programs, Persuasion organizes a presentation as a series of slides. Persuasion slides consist of one or more layers that contain text and/or graphics, including movies and animation, as well as still images. You can set up any number of master slides in order to create a consistent look for text and graphics, and you can specify spiffy transitions between slides (or between layers within a single slide).

Creating a basic slide sequence in Persuasion is straightforward: Choose a template (one of many supplied with the program or one you've built yourself). Enter text by typing directly on a slide or by using Persuasion's outliner, which turns your outline points into slide titles, subtitles, and body text automatically. To add graphics to your presentation, you can use the basic drawing tools built into Persuasion or import multimedia files in a variety of formats simply by dragging and dropping them onto a slide. (A CD-ROM's worth of images is included.)

With this version, for the first time, Persuasion imports native Photoshop and Illustrator files. Photoshop image layers translate automatically into Persuasion slide layers, so you can use Photoshop to create a graphic that "builds" as you add successive layers and then quickly incorporate the graphic into your

presentation. This is a great feature, but its implementation has room for improvement: Persuasion doesn't support transparency, so transparent areas of your Photoshop images import as white space. And Persuasion's Import dialog box, which gives you a choice between OK and Cancel for flattening imported Photoshop images, can be confusing.

Charting a New Course

Persuasion 4.0 also includes Adobe Chart, a new helper program that uses spreadsheetlike tools — including some basic computational formulas — to let you create a variety of charts and tables within your presentation. It's especially handy for updating your presentation with new data without rebuilding your slide.

Adobe Persuasion 4.0 lets you add links to your presentation that enable viewers to connect to up-to-date information on the World Wide Web. Also new is the floating Nudge palette (left), which makes it easier to position graphics on a slide, and the Photoshop-like Layers palette, which simplifies the navigation of layers.

Persuasion's ability to tie into the Web lets you be even more up-to-date in your presentations. And it's wonderfully easy. If you're connected to the Internet, you can select a URL from within your browser and drop it into an image or text in your presentation in order to create a live link to information on the Internet or within your intranet. You can also embed links to other slides within your presentation, much as you might link Web pages. And the included Adobe Acrobat Distiller lets you export presentations as PDF (Portable Document Format) files for placement on the Web. Anyone who has the Adobe Acrobat browser plug-in can view those PDF files, although most multimedia elements are lost.

The Persuasion manual suggests that you

can create an entire Web site within Persuasion, but although the program's linking capabilities are impressive, its files are far too large to be practical for online publishing.

Several new tools make Persuasion remarkably easy to use. Menu bars and key commands are more similar to those of other Adobe products. A new cropping tool lets you mask images to show only the portion you want for your presentation. The new Nudge floating palette lets you use arrows on the palette to position or scale graphics. And the new floating Layers palette helps you work with Persuasion's layers individually.

Persuasion 4.0 also introduces an eyedropper tool that lets you select a color from an imported image and put it into your active color palette. The eyedropper is great when

you want to match your text or drawings to elements of an imported picture; we only wish it were easier to get at. To use it, you must access the Edit Color Scheme command, in the color-palette menu; select the eyedropper tool; pick the color; and drop it into your palette.

Other (minor) complaints: We found that a new utility for translating Microsoft PowerPoint 4 presentations to Persuasion format gave results that were mediocre at best. And although Persuasion was perfectly speedy on a PowerPC system, it was annoyingly slow on a 68040 Macintosh.

Persuasion 4.0 includes fully working versions for both the Mac OS and Windows, and the manual manages to cover both versions gracefully. And in a further cross-platform nod, you can save your Persuasion presentations in an interchange format that can be viewed with the Persuasion viewer on either platform.

The Bottom Line

Useful, unique features, such as the ability to import Photoshop layers and drag and drop live URL links into presentations, make Persuasion the best program for creating business presentations. / Carolyn Bickford

Epson Expression 636

Outstanding color quality is new scanner's hallmark.

"GRAND COLOR FOR ABOUT a grand" could be the slogan of Epson's new Expression 636 desktop scanner. The new flatbed scanner, with an 8.5-x-11.7-inch image area, delivers impressive speed, minimal distortion, and outstanding color fidelity.

In terms of image quality — the ultimate determinant of scanner worth — the 636 is the best scanner we've seen in its price range (\$800 to \$1,800, depending on which of four software bundles you choose). In particular, its color fidelity — a traditional stumbling block for scanners in the 636's class — is exceptionally good. When we used its default scan mode, without any corrections or adjustments, the 636 surprised us with very good color that preserved most of the nuances of our tricky test images. The 636's color was so impressive, in fact, that its image quality topped that of all 16 desktop color scanners we tested in a recent article on sub-\$1,000 scanners ("Low-Cost Color Scanners: Quality for Less," February '97, page 88). The 636 is also one of the fastest scanners in its class. Our tests showed that only one scanner in our recent roundup — the Nikon ScanTouch 110 (\$500 estimated street) — matches the 636's speed.

The 636's scans also exhibited remarkably low signal noise, and the 636 was far more successful than most scanners in its class at capturing the full range of red, green, and blue color data. Like most other low-cost flatbed scanners, it did exhibit some "level dropping" (gaps in the range of captured data), particularly in the blue channel, but this was far less pronounced than we've seen with the 636's competitors.

No doubt, this is due in part to the Expression 636's 36-bit color sampling. The 636 assigns 12 data bits each to the red, green, and blue color channels, dividing each color into 2^{12} , or 4,096, levels. Most scanners in its price range sample color at 24 bits (2^8 , or 256 levels per channel) or 30 bits (2^{10} , or 1,024 levels per channel). The greater number of levels appears to pay off in greater precision and

subtlety in the Expression 636's colors.

The 636 *does* have some room for improvement, however. Most notably, scanned images tended to be "softer" than the originals, which necessitated application of a sharpening filter in Photoshop. This was a problem even after we applied prescan sharpening corrections in the 636's scanning software. This program, a Photoshop-compatible plug-in, is the Expression 636's chief weakness.

The Acquire module is easy to use and toggles between Simple and Advanced modes. In Simple mode, you answer a few questions about your original (whether it's photo or line art, color or black-and-white, print or transparency, and so on) and the program performs a scan automatically. As we've said, the results are impressive but not perfect.

In theory, you should be able to improve on that in Advanced mode, which performs a low-resolution prescan and lets you apply sharpness and color corrections to the image before the final scan. In practice, we found these controls ineffectual. The color controls had little effect; the sharpness tools had practically none at all.

Sprucing up scans from the Expression 636 in Photoshop isn't terribly difficult. Still, it's always best to make as many adjustments as possible before you scan, because Photoshop can never restore data that isn't captured to begin with. If you're a graphics pro, the Expression 636's prescan options may not meet your needs.

Aesthetically, the 636 is boxy and less than

elegant. When you add the optional transparency unit, it gets downright ugly. The unit, which is used for scanning slides, negatives, presentation transparencies, and other see-through media, nearly doubles the height of the entire scanner.

The 636 is available in four configurations, geared for users with different requirements. The Upgrade version (\$799) includes only the scanner and the plug-in. The Executive version (\$899) also comes with Adobe Photoshop LE and Second Glance Software's e-Paper, a document-management and -archiving package that includes Xerox's TextBridge optical-character-recognition software and business-card-scanning software. This option is meant for offices and light-graphics environments. The Artist version (\$1,299) includes a full version of Adobe Photoshop; Kai's Power Tools, from MetaTools; Claris Home Page; and e-Paper.

The Pro version (\$1,799) comes with Live Picture, Kai's Power Tools, Claris Home Page, e-Paper, and the transparency cover.

The Bottom Line

This scanner is exceptionally good for office use; graphics pros may want to consider using it with more-versatile third-party scanning software. / Rick Oldano

Epson Expression 636, Upgrade version, \$799; Executive version, \$899; Artist version, \$1,299; Pro version, \$1,799 (list). **Company:** Epson America, Torrance, CA; 800-463-7766; <http://www.epson.com/>. **Reader Service:** Circle #404.

The Epson Expression 636 is an easy-to-use color scanner for small businesses, but graphics professionals may find its software wanting.

QuickSite for Macintosh 1.0.3

Web-site builder bogs down in weak Windows-style interface.

POWERFUL WEB-PAGE-CREATION tools for the Mac seem to be cropping up almost as quickly as Web pages themselves: Adobe PageMill, Claris Home Page, Microsoft Front Page . . . But when it comes to creating and managing entire Web sites, there are precious few tools available. Adobe SiteMill and a few other tools can check links and help you administer a site, but DeltaPoint's QuickSite is the first Mac product ambitious enough to attempt to simplify creation and modification of entire Web sites. It's a great goal, but unfortunately, the product's poor interface and primitive Web authoring capabilities severely limit its appeal.

Windows Legacy

From the moment you launch QuickSite, the program shows its roots as a Windows application. DeltaPoint has obviously spent little effort making QuickSite behave as a Mac application should, and the result is an inconsistent interface that makes QuickSite frustratingly difficult to use.

In order to get you started, QuickSite provides the New Project Wizard, a built-in utility that walks you through a series of steps to create a home page and site structure. The home-page-creation steps make sense: It's easy, for example, to select a background image from among the samples that QuickSite supplies (in a folder that you can add to yourself). Then, as you view a thumbnail of your page, you choose styles for bullets and horizontal rules and enter header and footer information.

The Wizard proves less helpful when it's time for you to set up your Web site. You're given three options, for a Beginner, Intermediate, or Advanced site, and the structures for each are oddly arbitrary: What, we wondered, makes "a home page branching into two text pages and four menu pages" an Intermediate site? And what makes "a home page with two text pages, two menu pages, form, file, and URL menus" an Advanced site? A series of questions about what you *want* in your site

would be much more helpful.

QuickSite organizes sites through projects — each Web site is a project, contained within a proprietary QuickSite database file. You can create a project either from scratch or via QuickSite's Project Wizard, which provides you with a site skeleton you can then fill out quickly. When you're finished creating or updating a site, QuickSite exports HTML and graphics files from the database and can upload them to an external Web server via Internet FTP.

The Project window, the space where you organize your site and where you do most of your work in QuickSite, bears a striking resemblance to a spreadsheet. Within this window, you can see all the pages, images, downloadable files, and other items that make up your Web site. Items are listed hierarchically, but not using the Finder-style expand/collapse triangles and indentations Mac users have come to expect. Instead, QuickSite uses nonindented, Windows-standard plus and minus symbols to designate pages and enclosed items. This arrangement makes it very hard to tell where a file is located in the site hierarchy.

Unconventional Annoyances

QuickSite's interface problems go well beyond violation of Mac conventions. In fact, some of the program's behaviors are bafflingly bizarre. For instance, in order to change a page's title in the Project window, you have to carefully select the entire title and then delete it. What's more, QuickSite cells containing editable text look no different from "cells" that are actually option buttons you can toggle with a double-click. Single-click in one of these uneditable cells, however, and you get an I-beam insertion point, even though you can't enter any text.

QuickSite also ignores Mac OS technology that could bring vast improvement in ease of use. Most notably, you can't click and drag pages to rearrange them within the Project window. Instead, you must move them by using unwieldy menu commands. The net result is that users will find the Project window confusing and difficult to use, even after prolonged exposure to it.

Primitive Tools

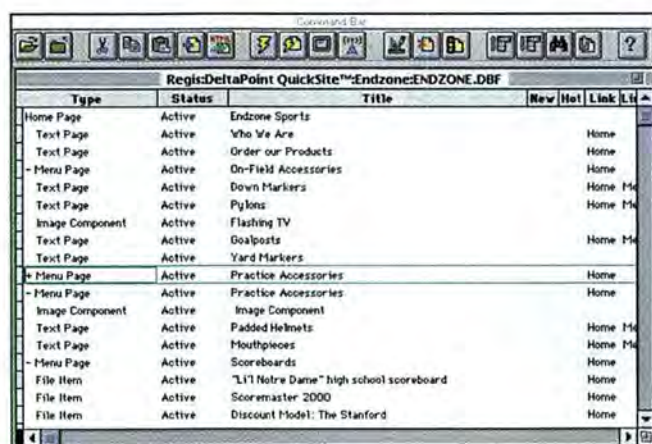

QuickSite's HTML editing tools are rudimentary at best. You can insert HTML tags but can view them only as raw HTML code — there's no graphical HTML editing mode, unlike in PageMill and programs of its ilk. You can, however, add URLs to your project and then insert the hyperlinks throughout your document via a wildcard system — a sort of hypertext find-and-replace tool: For example, every instance of *Apple* in your HTML document can be replaced with the words *Apple Computer*, hyperlinked to <http://www.apple.com/>.

Experienced HTML jockeys and people who are used to working with PageMill will appreciate QuickSite's provisions for entering HTML code directly into a page. However, if you take advantage of this, you'll forfeit QuickSite's strongest feature — the ability to automatically generate links to the other pages in your project.

The Bottom Line

For a truly useful site-building tool, wait for NetObjects' Fusion, which is due out by the time you read this. / Jason Snell

QuickSite for Macintosh 1.0.3, \$99.95/\$79.95 to register trial download version (list). **Company:** DeltaPoint, Monterey, CA; 800-446-6955 or 408-648-4000; <http://www.deltapoint.com/>. **Reader Service:** Circle #405.

A spreadsheetlike interface, lacking Mac-standard expand/collapse triangles to denote hierarchical relationships, makes QuickSite for Macintosh hard to navigate.

Cubase 3.0 VST

All-purpose pro music package works to great effect.

PAGEMAKER VERSUS QUARK? Illustrator versus FreeHand? This is kid stuff. To experience real cutthroat competition among Mac OS-software vendors, you need look no further than the professional MIDI-software market. With each revision, the MIDI heavyweights — Opcode, Mark of the Unicorn, Emagic, and Steinberg — pile feature after feature into their sequencer/digital-audio programs, hoping to leapfrog the competition. Although Steinberg's latest sequencer/digital-audio application, Cubase 3.0 VST, may not lap the pack, its outstanding real-time audio effects and equalization tools manage to set new standards.

Cubase contains the features expected in a professional sequencer/digital-audio application — real-time MIDI editing in list, graphical, and notation views; waveform editing; a multitude of synchronization options (SMPTE, MIDI time code, MIDI machine control); an arrangements window with MIDI and audio data arrayed in movable blocks; graphical editing of controller data; QuickTime-movie support; and an on-screen virtual mixing board.

In addition, Cubase allows you to employ the PowerPC processor for recording digital-audio tracks rather than requiring an add-

on digital-audio card as does Mark of the Unicorn's Digital Performer. Depending on your Power Macintosh model, you can expect to be able to record from 8 to 32 audio tracks. (Cubase requires at least a Power Macintosh 6100/66.)

VST: Very Snazzy Tracks

Although all these features work in harmony on even first-generation Power Macs, the features that set Cubase 3.0 VST apart from its rivals are the digital-audio effects represented by the trio of trailing consonants in its name. VST stands for *Virtual Studio Technology*, which provides four quality digital-effects units and four bands of parametric EQ (equalization) for each of your digital-audio channels. Even better, these effects can all be adjusted and played back in real time. (The effects and EQ affect only digital audio, not MIDI data.)

The included effects are Chorus, a chorus/flanger combination with adjustable delay time, feedback, width, and LFO frequency; ESpatial!, a flexible reverb that allows you to simulate large as well as small rooms; Auto Panner, an effect that moves sound across the stereo field; and Stereo Echo, an effect that allows echo effects as simple as slapback or as complex as multitap delays. Because these effects are based on a plug-in architecture, expect additional effects to be available from third-party vendors. You can use the effects in conjunction with one another, and you're welcome to duplicate effects. For example, you can apply three discrete reverb effects as well as Auto Pan to a single audio track.

We made extensive use of Cubase's VST features in our test projects and were quite satisfied with the quality of the effects and EQ. In particular, we were tickled to be able to change effect and EQ settings and hear the changes in real time. Although you can apply changes in audio track EQ in such programs as Opcode's StudioVision Pro, you must apply the EQ change and then save it — there's no way to preview that change. Certainly VST isn't going to replace high-end Lexicon boxes in recording studios across the globe, but it's more than adequate for quality demos and multimedia projects.

We were also pleased with the overall performance of the program. Although the manual recommends that you use a fast hard-disk drive and a powerful Power Macintosh (with a Level 2 cache), we were able to reliably play MIDI tracks plus eight channels of audio (with effects and EQ on most channels) from an Iomega Jaz drive running on a system — a Power Macintosh 6100/66 accelerated to 78.5 MHz with an add-on clock chip — that only slightly exceeded Cubase's minimum requirements. Note: Your Power Macintosh must have a Level 2 cache card in order to record audio.

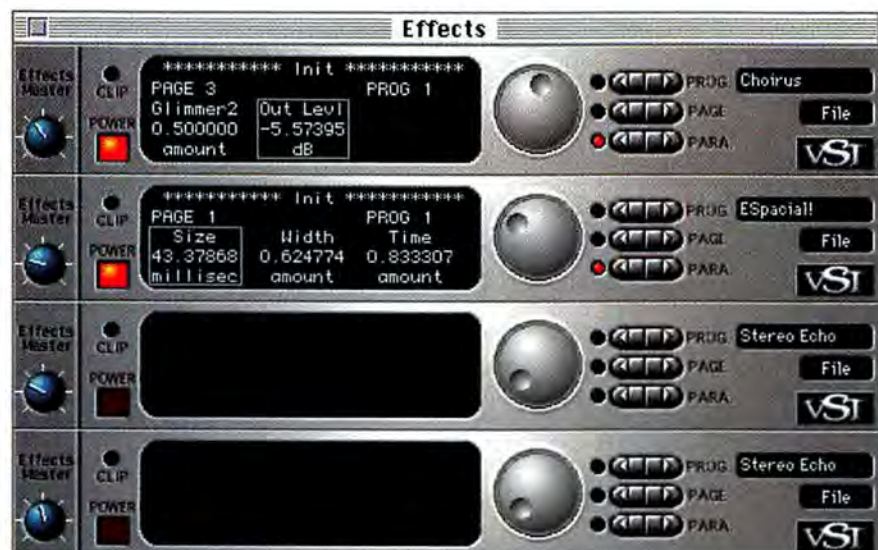

Our only complaints about Cubase 3.0 VST are largely based on the cosmetics of the application. The VST Effects interface looks exactly like a hardware effects unit — complete with a jog wheel and a tiny alphanumeric display and multiple "pages" of effect settings. We admit, it's cute and accessible to audio pros, but those of us who are also familiar with computers would appreciate a single dialog box in which we were able to enter parameter values.

We also wish Cubase would take a cue from Opcode's Studio Vision program and provide an integrated mixing board where you can view audio as well as MIDI tracks in a single window. Cubase requires separate consoles for MIDI and audio.

The Bottom Line

Cubase 3.0 VST is a solid sequencer and a well-integrated digital-audio editor. But its stand-out feature is its suite of real-time digital-audio effects and equalization tools. Overlook the minor interface shortcomings, and you'll be pleased with this sequencer/digitizer.

/ Christopher Breen

Impressive audio-effects and equalization modules in Cubase VST look just like their hardware equivalents.

Cubase 3.0 VST, \$799 (list). **Company:** Steinberg North America, Chatsworth, CA; 818-993-4091; <http://www.steinberg-na.com/>. **Reader Service:** Circle #406.

The Palace

Meet, greet, and maybe get lost at a cyberspace costume party.

VIRTUAL COCKTAIL PARTIES are the new spin for Internet chats. The Palace — software that gives you access to an array of virtual places to mingle and meet — is a cartoon masked ball. For all its kinetic kicks, however, The Palace still has some kinks.

The Palace's appeal lies in its opportunity for self-expression. As you wander from room to room in a Palace site, you are represented by a visual stand-in, called an avatar, that you've created. You can outfit your avatar with props and even animate it.

You chat with other avatars via little word balloons. If you find someone intriguing, you can adjourn to a one-on-one chat. You can also jump to other Palace sites, including numerous commercial sites sponsored by the likes of Fox TV, or create and host your own Palace.

For all its fun, The Palace suffers from the awkwardness of infancy. It's easy to get trapped, lost, and frustrated. Basic concepts (such as how to return to a previous Palace site) are unexplained. Site maps are nonexistent or skeletal, and hot spots are hard to find.

Buy the boxed version for \$49.95, or download the software free from the Palace Web site (a \$25 registration fee gives you access to all the special features).

The Bottom Line

The Palace is a great idea with lots of cool potential, but we're still waiting for it to outgrow its awkward adolescence. / Brooke C. Wheeler

The Palace, \$49.95 (list); \$25 (registration after free download). **Company:** The Palace, Beaverton, OR; 503-626-7575; <http://www.thepalace.com/>. **Reader Service:** Circle #407.

The Palace adds visuals to online chat.

The Monitor that Shows You the Whole Dam Thing.

The Pivot 1700[™] has other 17" color monitors beat from top to bottom. It pivots from horizontal to vertical mode to give you the tallest, sharpest display you can get. Taller, even, than a 21" monitor! And much more affordable. So now you can read a full 8.5"x11" page *without scrolling*.

Call us today or, if you prefer, e-mail us at pdcalif@aol.com for the whole story.

MacUser

COMING SOON

MAY '97

DON'T MISS IT!

CD-ROM DRIVES

If you haven't yet ponied up for a CD-ROM drive, or if you're looking to upgrade your existing one, then you won't want to miss the May issue of MacUser. In the Labs Report, MacUser tests and reviews 8x and higher external CD-ROM drives. Find out whether there is a gain in speed and performance when upgrading to an 8x drive. There will also be helpful shopping tips including what types of ports and software to look for when buying a CD-ROM drive.

THE FUTURE OF STORAGE

There is a revolution on our Macintosh horizon. Look for high-speed storage connections to merge with networks to create vastly faster and more versatile connection schemes. MacUser Labs tests fiber-channel, serial storage architecture, firewire, Ultra SCSI and other high-speed connections. No where else will you find trusted coverage on this developing storage technology.

DTP TOOLKIT

In the May issue, MacUser takes a comprehensive look at must-have tools for professional desktop publishers who specialize in design and production. With feedback from real-world desktop publishers, MacUser rounds-up products essential for doing their jobs effectively. If you're a desktop publisher, find out from the experts what you'll need to enhance your own toolkit.

QX-Tools 2.0

Great QuarkXPress add-on set gets even better in upgrade.

SURPASSING A SUCCESS like QX-Tools 1.0 is no easy task: The debut version of the Quark XTension collection offered ten very useful design tools for about \$100. But with QX-Tools 2.0, developer Extensis has managed to top itself handily: QX-Tools updates the original tools and adds five extremely useful new XTensions to the set — without any increase in price.

Whereas QX-Tools' main competition, the XPert Tools collections, from a lowly apprentice production, looks to streamline nuts-and-bolts QuarkXPress production work, QX-Tools is clearly aimed at QuarkXPress designers. And, frankly, we can't imagine designing without it.

The coolest addition is QX-Effects, a versatile tool for creating shadow, bevel, emboss, and glow effects directly within QuarkXPress. It offers a tremendous array of effects and easy-to-understand controls. QX-Effects nicely complements the QX-Filters XTension introduced in version 1.0, which lets you apply Photoshop filters to images from within QuarkXPress itself. These two XTensions in tandem let you create gorgeous continuous-tone effects — without ever launching Photoshop.

Even if you hate palettes, you'll love QX-FineTune, a "palette of palettes" that lets you tweak most of Quark's formatting options without using dialog boxes or typing in point sizes. You can adjust a host of parameters such as paragraph indents, leading, character spacing, drop-cap size, and rule weight interactively: Click on the size-up or size-down arrow next to the attribute you're changing, and watch your page update accordingly. Terrific.

You can use another new XTension, QX-CopyStyles, to extract formatting information from a selected box or text block and reapply it elsewhere. It's not as cool as having style sheets for objects, but it can save a lot of time when you need to make one page element look like another.

When you want just *one* attribute on all your pages to change, you can use the new QX-FindChange XTension. It's the mother of all search-and-replace tools: You can base

searches on no fewer than *nine* tabbed pages of attributes, from colors to styles to tracking settings — just about any QuarkXPress attribute.

QX-DocStyles lets you define, name, and quickly call up document settings. There's even a handy menu for selecting portrait or landscape.

As to the legacy XTensions from version 1.0, the most notable refinement is in QX-Bars, the tool-palette-creation XTension. It now has a SmartBar, which creates buttons for various actions as you perform them. QX-Filters and the other remaining QX-Tools XTensions remain much the same as in 1.0 — which is to say very good indeed: QX-Dingbats still displays all the special characters in a designated font set; QX-Layers aids page-layer navigation; QX-Viewer generates navigable thumbnails of your layouts; QX-Scaler automates scaling of groups of text and objects; QX-Tips & Tricks displays, well, tips and tricks on using QuarkXPress; QX-Print lets you control a variety of output characteristics; QX-Styles lets you apply multiple styles within the same paragraph; and QX-Manager lets you determine which XTensions load with your copy of QuarkXPress.

Despite our overall enthusiasm for QX-Tools, we did run into a few snags: We noticed, for instance, that QX-Print disables many page-setup options with System 7.5.5 and LaserWriter 8.4.1. We also found that QX-Viewer sometimes slightly slows QuarkXPress' overall speed.

The Bottom Line

If you design pages in QuarkXPress and don't already own QX-Tools, get it; if you do own version 1.0, spring for the \$49.95 upgrade.

/ Eric S. Taub

QX-Tools 2.0, \$99.95 (list). **Company:** Extensis, Portland, OR; 800-796-9798 or 503-274-2020; <http://www.extensis.com/>. **Reader Service:** Circle #408.

Shadow (shown here), Glow, and Emboss are among the effects you can create by using QX-Tools' QX-Effects XTension within QuarkXPress.

CTX Opto PanoView 600

LCD monitor is a costly but portable alternative to a CRT.

AT FIRST BLUSH, spending \$3,000 on a 12.1-inch monitor sounds like a bad move. But the PanoView 600, from CTX Opto, is no ordinary monitor: It's a lightweight, active-matrix LCD monitor less than 2 inches deep, with built-in speakers — and it folds to a compact size. It's not for everyone, but if you routinely lug CRT monitors to meetings or if your desk space is at an extreme premium, the hefty price just might be worth it to you. But you'll have to get past the monitor's clumsy Mac setup and its lo-fi speakers.

The design of the PanoView is spare and functional: It offers most of the features of a desktop monitor plus the ability to fold up easily so that it's small enough to fit comfortably in an airliner's overhead bin. (Try that with a conventional monitor.) The screen sits atop a small stand, which tilts so that you can adjust the LCD's viewing angle for optimum image quality. Power is supplied via a small transformer box that includes an AC cord. CTX Opto supplies a VGA video cable, a Mac adapter, and cables for the PanoView's built-in speakers.

You adjust the PanoView with four small buttons located on the screen bezel, just below the LCD. They invoke easy-to-use on-screen menus with an impressive range of controls no PowerBook screen has ever offered: In addition to standard brightness and contrast controls, you get vertical and horizontal image positioning; tracking; and even individual red, green, and blue color-level adjustments. You also use an on-screen menu to control speaker volume, balance, and tone and to choose among four audio modes: Simulated 3-D surround sound; standard stereo; pseudostereo, which approximates stereo sound from a monaural source; and mono, which merges two stereo channels into a monaural signal.

There is a power switch on the back of the PanoView, but we didn't use it, since the PanoView sleeps when it doesn't detect an incoming video signal.

Adapting to Adapters

We ran into a few glitches while setting up our PanoView. The supplied Mac-to-VGA monitor adapter supported only 640-x-480-pixel resolution, which the PanoView centered inside its larger 800-x-600-pixel LCD. We tried the monitor's Oversize feature, which expands any image to full-screen size, but found that the PanoView accomplished this by occasionally repeating rows and columns of pixels, which created noticeable distortion on the screen. We then found a monitor adapter that supported 800-x-600-pixel VGA resolution

(compatible with newer PowerPC systems and PCI-based graphics cards) — and the results were much better. After we tweaked the Sync and Fine Tune controls, our PanoView displayed a rock-steady 800-x-600-pixel image that filled the entire screen. (At press time, CTX Opto was working to bundle a new Mac adapter that supports 800-x-600-pixel resolution with the PanoView. Until then, the additional adapter to support 800-x-600-pixel resolution will set you back about \$20.)

Great Color Quality

Image quality on the PanoView is quite good, easily comparable to that of the best notebook LCD screens we've seen. That's no big surprise, since the PanoView uses an active-matrix LCD, much like the PowerBook 1400ce's and 5300ce's before it. Sharpness, contrast, and screen response were excellent, and colors were rich and saturated.

Color professionals who need to match screen image to printed output will have to stick with CRT-based displays, because there's no way to color-calibrate the PanoView (or any LCD screen, for that matter). What's more, the screen contrast varies considerably as you change your viewing angle. Within these constraints (which are familiar to many PowerBook users), photographic images we displayed on the PanoView looked realistic and were fine for business-communications purposes.

We didn't expect much of the PanoView's stereo speakers, given their location. Since they're embedded in the display's shallow (less than one-inch-deep) bezel, their resonance capacity is inherently limited. Even so, we were surprised at how poor their tone was — worse than that of a Mac's built-in mono speaker. You can get away with using the PanoView speakers for spoken-voice narration, but if you want music or sound effects to have any impact, plan on using external speakers with the PanoView.

The Bottom Line

Once you get it set up with the right adapter, the CTX Opto PanoView 600 delivers excellent image quality. Its built-in speakers are so-so, but the PanoView is far more portable than a CRT monitor. For many, this alone will be enough to justify its steep price. / Jeff Pittelkau

The PanoView 600, from CTX Opto, is a high-quality 12.1-inch LCD display system with built-in stereo speakers that's much easier to tote from presentation to presentation than a conventional CRT monitor.

CTX Opto PanoView 600, \$2,995 (list). **Company:** CTX Opto, Sunnyvale, CA; 888-289-6786 or 408-541-6060; <http://www.ctxopto.com/>. **Reader Service:** Circle #409.

The ultimate presentation power tool.

You've got powerful ideas. And finally, there's a tool that can bring them to life. Introducing the Epson® PowerLite™ 5000 SVGA projector. With the perfect combination of portability, brightness and versatility, you can now deliver dazzling presentations anytime, anywhere.

The world leader in high-performance, portable projectors. With 450 ANSI lumens, it's the brightest portable SVGA projector in its class, so you can make brilliant

presentations *without* turning off the lights. All of this comes in a compact package that weighs about 14 lbs., so it is easy to take on the road. Plus, Epson's revolutionary SizeWise™ Resizing Technology even reproduces high-resolution XGA images with astonishing clarity.

Greater versatility and ease-of-use. In just seconds, you can connect to two computers (PC/Mac) *plus* a VCR, simultaneously. The Epson PowerLite 5000 supports full-motion video, colorful text, animated graphics and 3-D stereo sound to add more impact to your multimedia presentations. And with our new Chronos™ lamp, you can get about five years of lamp life, without the hassle or expense of constant lamp changes. For added confidence on the road, Epson's Road Service Program can offer a replacement projector, usually overnight.

So, whether you're going around the corner or around the world, the Epson PowerLite 5000 gives you the power to make the ultimate presentation...every time. For more information, call our toll-free number or visit us at www.epson.com.

The PowerLite 5000 is the newest member of our award-winning line of 3-LCD high-performance projectors.

Claris Organizer 2.0

Easy-to-use PIM gets even easier with upgrade.

THE CHILI-PEPPER WALLPAPER may be the first thing that catches your eye in Claris Organizer 2.0, but even without the Decors option, you'd be able to tell easily that the program has received a major upgrade. Organizer retains the same basic organization as the original version, with four integrated modules (Contact, Task, Calendar, and Notes), but it's got a new look resembling that of a loose-leaf daily planner — and several helpful new features are under the hood. Organizer continues to be appealingly easy to use, but it still has some shortcomings in the handling of multiple simultaneous events.

The least-important addition to Claris Organizer, the Decors feature, is the one you'll notice first: It allows you to customize the way Claris Organizer looks, by filling windows, calendar borders, and other interface features with 1 of 14 custom patterns.

One of Organizer 2.0's handiest new features is the InstantOrganizer, which adds an Organizer pull-down menu to your menu bar. The menu allows you to search for or add new contacts to the Organizer database without launching Organizer itself. (Search results take a few seconds to appear, but they take less time than is needed to launch Organizer.) It also lists each day's appointments and times and stores your list of often needed phone numbers. It's convenient — and one of the only features Organizer 1.0 lacked in comparison to more-expensive "professional" PIMs.

Other minor deficiencies Organizer 2.0 corrects are version 1.0's lack of calendar banners for multiday events and the absence of a reminder alarm for upcoming events. (Organizer 2.0 even includes a special checkbox in each contact entry for an automatic birthday reminder.)

Information Exchange

Organizer 2.0 expands the flexibility with which you can share info among its calendar, address-book, and notes features. You can attach any calendar entry — be it a banner for

a multiday event, a meeting, or a to-do — to any other event, contact, or note or even to a non-Organizer file — such as a letter created in your word processor — by dragging and dropping or by using the grabber tool to create links. Type "Meeting with John Smith" as the title for an event, and you're greeted with a window displaying a pick list of all the John Smiths in your database. You select one or all of the listed contacts to automatically attach them to an event.

Organizer 2.0 adds several refinements to the contact card — the page in which you enter and view information about your contacts. In the main view, you're shown only those fields that contain data; if someone has no fax number, there's no blank marked Fax, for example. This provides a clean, orderly view and reduces the cluttered look that plagues other PIMs. (In order to add new information to a contact card, you double-click on the appropriate area, and you're shown fields to fill in.) You now get 11 customizable fields, a great improvement over the 4 furnished in version 1.0.

Instant Links is a mail-merge-like feature that uses AppleScript and a series of Organizer templates to build custom form letters and other word-processing documents. You get scripts and templates only for ClarisWorks 4.0 and MacWrite Pro and scripts for Netscape Navigator and Claris eMailer, but Claris plans to post other scripts on its Web site.

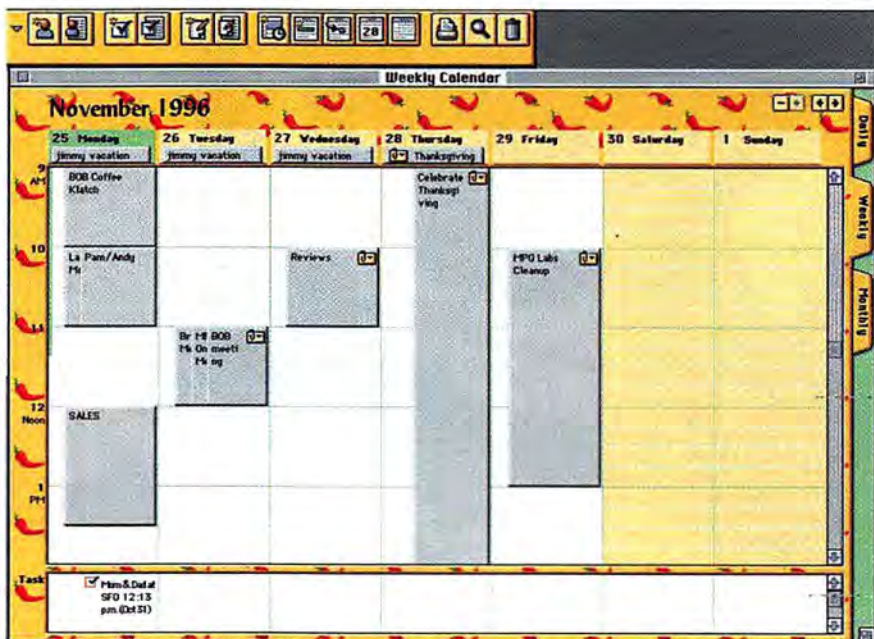

We liked the new file-synchronization feature, which lets you maintain two separate copies of Organizer (one on your desktop computer and one on a PowerBook, for example) and have them update each other automatically.

The chief drawback of the Organizer 2.0 package is the lack of group-calendar capabilities. The program's inability to share file and schedule information over a network makes it unsuitable for office use. That's fair enough, because Organizer doesn't pretend to be a workgroup tool, but the Organizer calendar's poor handling of simultaneous events makes it hard to use even for a busy family. The calendar stacks simultaneous event entries, so only the topmost one is fully visible. That prevents you from seeing at a glance that, for example, your club meeting and your child's baseball practice fall at the same time. We'd love to see Claris adopt Now-Up-to-Date's method of handling simultaneous events: NUD scales event entries so they are all visible at a glance.

The Bottom Line

Claris Organizer 2.0 is a great program for managing your personal schedule, as long as you don't need to track lots of simultaneous events. / Jeff Battersby

Claris Organizer 2.0, \$69 (list). **Company:** Claris, Santa Clara, CA; 800-544-8554 or 408-987-7000; <http://www.claris.com/>. **Reader Service:** Circle #410.

The folder icon in each Claris Organizer 2.0 calendar entry is used to link events to contacts, other events, or any document; the Decors feature adds 1 of 14 custom looks (such as these chili peppers) to the program.

In case anyone is wondering whether they could get one of these by Christmas - I ordered mine (a basic, no-frills version) on November 25; it was built on Nov. 27; and it arrived in my office on Monday December 2. Exactly one week and over a Thanksgiving weekend! In fact, it has arrived too early - I'm having to hide in my office until I can put it under the tree.

five mice rating. The PowerTower Pro was the first Mac OS machine in nearly a decade to achieve this kind of recognition. PowerBase was the second. MacWeek agrees. In fact, their highest rating of five diamonds has lately been attached a lot lately to the name, Power Computing. All this tells us is that we're just doing the job we set out to

do in the first place. And that's to make the best Mac OS machines on the planet, at prices well below what Macintosh users have been used to paying in the past.

Awards are nice, but it's what they represent that counts. And that is to satisfy all those who own Power Computing systems.

Based on system design and features, there's no question the PowerBase is still the best SOHO Mac. Despite their aggressive pricing, you simply don't get as much with a Motorola StarMax or UMAX

WatchIT!

Time-tracking utility proves cumbersome to use.

HOW DO YOU SPEND YOUR TIME at the Mac? If you bill clients on an hourly basis, the question is more than academic. WatchIT! can furnish the answer in vivid detail — if you have the patience to configure it and use it properly. And that's a big if.

To set up WatchIT!, you tell it which applications (or specific file windows) you want to track. When you're working in a given file or window, you assign it a Job and Task category. At the end of any interval you choose, WatchIT! generates a report that shows the total time you spent working in a given window, application, job, or task.

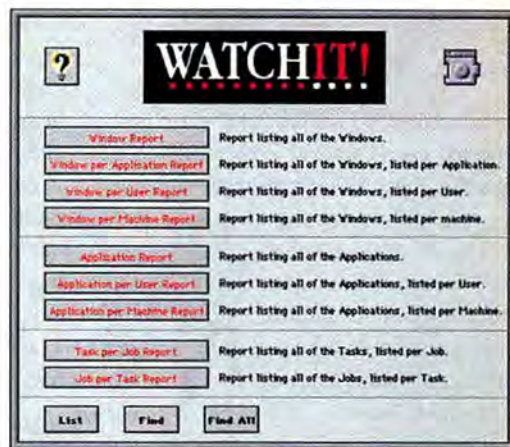

You can even configure WatchIT! to collect info from multiple systems on a network and generate an officewide time log. (In a rather Orwellian twist, the WatchIT! extension can be installed invisibly and used to track activity on an application-by-application basis.)

WatchIT! enters Paused mode after a period of keyboard or mouse-button inactivity you specify. When you resume work, you can assign the paused time to a given Job or Task. That's fine, as long as you spent the entire interval on one thing, but there's no provision for phone calls to multiple clients, for example.

The WatchIT! system extension proved remarkably stable. But WatchIT! installs no fewer than five additional miniprograms along with the extension.

In addition to all that clutter, you have to put up with extreme tedium to track windows. You must remember to assign a Job and Task designation each time you use the New command, for instance. Nevertheless, it's the only way to log time accurately if you use a given application for work on multiple projects.

WatchIT!'s reports are output as FileMaker Runtime documents that constrain you to sorting by window, application, day, machine, user, or job. You can sub-sort by one additional criterion, but there's no way for you to see all your information simultaneously — unless

You have a variety of ways to sort the time data WatchIT! collects, but no single view lets you see all your information.

you export it to a spreadsheet. Fortunately, free tech support is available via e-mail.

The Bottom Line

Great for monitoring others' application use, but only marginally useful for personal time tracking. / Mark Binder and Jim Shatz-Akin

WatchIT!, \$99; 5-pack, \$445; 10-pack, \$799; 25-pack, \$1,850 (list). **Company:** Hi Resolution, Foxboro, MA; 800-455-0888 or 508-543-6955; <http://www.hi-resolution.com/>. **Reader Service:** Circle #411.

Tailor Visual PostScript Editor 1.1

View, troubleshoot, revise, or repair PostScript documents.

A SWISS-ARMY KNIFE FOR working with PostScript, Tailor, from EnFocus Software, can open nearly any PostScript print-to-disk (PS, for short) or encapsulated PostScript (EPS) file — even EPS files nested within other EPS or PS files. And no matter what application created the file, you'll be able to view and edit its PostScript content on-screen. You can adjust Bézier curves and lines, assign (or change) colors, edit text and change its style, and control other details that are normally inaccessible once a file has been separated from its original application.

Tailor provides several helpful warnings. It alerts you to any defects in the PostScript code

as it imports a file — if it doesn't find any problems, the file should output correctly to a PostScript device. It also warns you of missing fonts and allows you to choose whether to view a substitute font on-screen or to have Tailor try to convert the type characters to paths, using embedded font information.

When you have finished with a file, Tailor exports it as an EPS file, a downloadable PostScript file, or an Adobe Illustrator 3 document. Tailor allows you to extract an EPS graphic from an open file, creating a new EPS file, complete with screen preview. And it allows you to export text — formatted, as plain ASCII, or with Rich Text Format (RTF) tags.

Tailor supports AppleScript; a script called Tailor Converter, designed to automate repetitive operations, is included. A printed manual ships with Tailor, and there is also online documentation (in HTML format — a viewer is included).

For all its strengths, Tailor has flaws. Its tools look familiar, but they don't all work as you'd expect. You need to be careful about where you place the cursor when you attempt to move an object, for example, or the object is likely to be resized, rotated, or otherwise

transformed instead. And although Tailor does a good job of preserving PostScript subtleties, it strips documents of device-specific settings, such as print-screen angles and frequencies. It discards OPI comments as well, and it has several font-related limitations, including lack of support for multiple-master and composite fonts.

Unlike Tailor 1.0, which required QuickDraw GX, Tailor 1.1 runs on any Mac with a 68020 or more powerful CPU, System 7.5 or later, and at least 8 MB of RAM (12 to 16 MB is recommended). It needs a great deal of RAM for the files, which are held completely in memory as you work on them, so its RAM requirements should be taken seriously.

The Bottom Line

Despite the program's weaknesses, Tailor will probably pay for itself quickly if you frequently deal with PostScript files from myriad sources — something service bureaus often need to do. / Kathleen Tinkel

Tailor Visual PostScript Editor 1.1, \$495 commercial/\$295 educational (list). **Company:** EnFocus Software, Denver, CO; 888-363-6287 or 303-297-9096; <http://www.enfocus.com/>. **Reader Service:** Circle #412.

Everyday Animals, The Object Series, Number 18 ★★★★★

FROM YAWNING MUTTS to lop-eared goats, this disc has a barnload of personality. You'll find the Object Series' trademark high quality and quirky composition in all 120 drum-scanned RGB images, which come in three resolutions. Built-in clipping paths and helpful instructions save Photoshop fuss. / Scholle Sawyer

Pyst ★★

BIG SUCCESSES make the best targets for parody, and *Myst*, the most popular CD-ROM game yet, is certainly fair game. And that's without considering the spoof potential of its brother-versus-brother plot or its setting — an uninhabited island crammed with arcane books and improbable gadgetry. How sad, then, that *Pyst*, from Parrotty Interactive, offers such misguided satire.

The joke: The *Myst* island has been trashed by visitors and you get to witness the chaotic aftermath. Fair enough, but we doubt that the same audience that delighted to the subtle puzzles of *Myst* will guffaw at such lame slapstick as kamikaze seagulls, demented rats, or *Roseanne's* John Goodman belching in a hot tub as the island's King Matruss.

A good parody takes rapier wit, comedic timing, and a sense of its subject. *Pyst* misses more than hits. / LaMont Ridgell

Pyst, \$15 (estimated street). **Company:** Parrotty Interactive, Larkspur, CA; 415-464-5500; <http://www.palladiumnet.com/>. **Reader Service:** Circle #415.

ZipZAPP Pro ★★★★★

NO PIECE OF MAIL needs to go unsent for want of a ZIP code, thanks to ZipZAPP Pro, a CD-ROM database from True BASIC. It quickly produces the right ZIP code for any municipality. Search by city or town, ZIP code, or area code, and the corresponding information scrolls instantly into view. For large cities, ZipZAPP even provides exact ZIP codes for each street and address range.

No one-trick pony, ZipZAPP Pro's database can also furnish other useful information, such as any locale's time zone, travel distances between cities, or even the average income and growth rate of a given county.

ZipZAPP Pro is updated twice yearly. True BASIC has promised that the next revision, due in the spring of 1997, will correct a minor bug that skews column headers to the right. Registered users pay \$29 for each upgrade — a savings of 25 percent. Subscriptions are offered at extra cost. / Brooke C. Wheeler

ZipZAPP Pro, \$39 (direct); upgrade, \$29. **Company:** True BASIC, West Lebanon, NH; 800-436-2111 or 603-298-8517; <http://www.truebasic.com/>. **Reader Service:** Circle #417.

Extraordinary Cartographic Motifs, Visual Language Library, Vol. IV ★★★★★

SAILING SHIPS, compass rosettes, dragons, and globes are just a few of the mapmaker's flourishes you'll find on this CD-ROM. Unfortunately, although these 65 drum-scanned images have been separated from the maps where they originated, none are isolated from

their backgrounds. That means lots of tweaking in Photoshop before you can use them as decorations. As long as you have to go to all that trouble, you might as well purchase one of Visual Language's truly superb CD-

ROM map collections and see the motifs as their creators intended. / Scholle Sawyer

Extraordinary Cartographic Motifs, Visual Language Library, Vol. IV, \$169.95 (list). **Company:** Visual Language, Las Vegas, NV (distributed by Image Club); 800-661-9410 or 403-262-8008; <http://www.imageclub.com/>. **Reader Service:** Circle #416.

Muppet Treasure Island ★★★★★

MUPPET TREASURE ISLAND crams into three CDs everything including the kitchen sink (watch for the explosion).

You're Hawkins, the pirate-hero, and you must go on three connected journeys to find buried treasure on Treasure Island. Along the way, you need to unearth clues to obtain a map, ship, and crew — if you can call the likes of Rizzo the Rat crew members — but you're

never alone, as your faithful, wisecracking parrot Stevenson helps you along the way. You must also select the right eye patch, earn money for new clothes by splatting pirates with pies, and complete a series of chores while on the ship *The Hispaniola*.

The game is fun, but it lacks a few features that would make for smooth sailing. For example, figuring out how to navigate the game's crowded environment is not always obvious. Make sure to read the accompanying booklet for important insights.

Still, as one would expect from Jim Henson Productions, the graphics are gorgeous and the character interaction makes you feel like you're in their world. / LaMont Ridgell

Elroy's Costume Closet ★★★★★

AFTER HITTING THE BRICKS in their last title, Elroy and Syd are back together for a fun-filled romp through Elroy's Costume Closet. In this story, Elroy and Syd are on their way home after discovering that the places they wanted to go to (such as the cherry bomb factory) are closed. They end up in a theater as the stars of... well, anything the costumes you choose suggest. You can dress Elroy and Syd in any of the more than 100 costume variations. And if you choose the right clothing combination, you kick off one of more than 75 animated skits. You can shimmy online to download more from Costume Headquarters (<http://www.headbone.com/>). The program encourages you to print your creations, color them, and make stick puppets or even paper dolls.

Wait 'til you hear what Elroy has to say when it's his turn to be the mermaid and walk the plank. / LaMont Ridgell

Best Monochrome-Laser-

THE MAC MARKET was ignited with the introduction of the monochrome laser printer almost a decade ago. Using a page-description language from Adobe, the first monochrome laser printers produced smooth-looking fonts at any point size, printed grayscale art and photographs, and challenged traditional printing techniques. The DTP revolution had begun, and the admission price would be over \$8,000 — and that didn't include the price of a Mac.

Today's monochrome laser printers have evolved to feature higher resolutions, higher engine speeds, better paper handling, full network connectivity, and impressively low prices. And instead of be-all, end-all laser printers that print every kind of document — 50-page text files, highly detailed and illustrated documents, simple spreadsheets with pie charts — monochrome laser printers in the current crop are marketed to unique, separate segments. If you're printing 50-page text files, you want a fast printer; if you're printing highly detailed and illustrated documents, you want the best output

quality; if you're printing a spreadsheet, you want a good combination of speed and output quality.

Which printer is best suited for the type of files you print most often? To find out, MacUser Labs rounded up 11 of the survivors and put them through their paces to find out which monochrome laser printer is right for you and your files.

Understanding Test Results

If you looked at our printer test results and picked the top performer in every test, then you could choose a printer that may not be appropriate for your pocketbook or for the files you print. When comparing test results, take into account what your normal printing needs are and go from there. Here are some tips on how to view our individual test files in light of the type of printing you do.

PHOTOGRAPHY / MICHAEL FALCONER

If your daily print jobs consist mostly of text documents for reports and memos, then the best performer in our 20-page-text-document test, the Xerox DocuPrint 4517mp,

NUMBERS THAT ARE FIT TO PRINT / how fast can each printer go?

TO MEASURE THE SPEED of each printer for this review, we ran three tests. The Word-document test measures how long it takes a printer to print a simple text document that uses a ROM-resident font in the printer. The Excel test gauges the printer's speed while it processes a mixture of text and simple grayscale graphics. The PowerPoint test uses a 5-page document that contains different types of graphic elements, from clip art to grayscale ramps.

The vendor's ppm rating does not take into account the amount of time it takes to transfer information from your Mac to your printer, nor does it allow for the time it takes a printer to process a job. Our test results indicate the amount of time it takes a printer to do an entire job, from the click on the Print button to when the last page of the job is completely out of the printer. The printers are listed in alphabetical order, and the fastest performer in each test is indicated by a red bar.

Printer Values

might be an ideal choice for your office. But if you want to print on tabloid-sized media, then the Hewlett-Packard LaserJet 4MV would be our choice, for two reasons: the 4MV supports tabloid media, and the text quality is among the best of the bunch, due to HP's proprietary Resolution Enhancement technology, which smoothes lines and fonts.

The HP LaserJet 6MP and the Xanté Accel-a-Writer 8300 finished well behind the pack in the text-document speed test, because they each have an engine rated at 8 pages per minute — the other printers we tested have 12-, 16-, or 17-ppm ratings. But the 6MP and the 8300 are very different printers — the 6MP is suited for small workgroups and personal use and has an estimated street price of less than \$1,000 (the most economical of the printers we tested), whereas the 8300 is geared to DTP/graphic-arts use, with features such as optional 1,200-x-1,200-dpi resolution, full-bleed 12-x-25-inch output, and calibration abilities. The 8300 has good speed for an 8-ppm printer (see the "Numbers That Are Fit to Print" charts), but its real claim to fame is its output quality — it was rated the best by our jury — and its DTP-specific features, including gatefold printing, gamma adjustments, and calibration.

If your files are a mixture of text and simple graphics, take a look at the 17-ppm Digital LN17ps. If you want good speed and output quality but don't want to spend \$2,550, we suggest you take a look at the 12-ppm HP LaserJet 5M.

Spec Check

When shopping for a laser printer, you will no doubt encounter a slew of buzzwords and features that might be unfamiliar. In this section, we explain what key features to look for and what they mean.

Engine Speed. This is one of the most confusing aspects of purchasing a printer. The vendor's *ppm* (page per minute) rating is based on the engine manufacturer's printing-rate claim. The ppm rating indicates how long it takes the printer engine to pick up a

piece of paper and roll it through the marking engine and into the output tray. The problem with this rating method is that it doesn't account for the time it takes for a print job to travel from your Mac to your printer and it doesn't consider the processing of the job in the printer.

When we run our real-world battery of printer tests, we measure how long it takes from clicking on the Print button in the Print dialog box to when the last page falls into the output tray. In our simple 20-page-text-document test, none of the printers matched the vendors' ppm ratings. For example, the supposedly 16-ppm GCC Elite XL 616 performed more like a 9-ppm printer. As we went to press, GCC announced a processor upgrade (the unit we tested had a 25-MHz AMD RISC processor; the new processor will be a 40-MHz AMD RISC processor) and new NetWare support for the Elite printer series.

Resolution. Not long ago, the standard printer resolution was 300 x 300 dpi. Now, the resolution standard has increased to 600 x 600 dpi. The increase provides an obvious quality difference, for both text and graphics.

If you increase the amount of RAM installed in the printer, the Digital LN17ps, Lexmark Optra Lx+, Xanté Accel-a-Writer 8300, and Xerox DocuPrint 4517mp are all capable of resolutions as high as 1,200 dpi. A printer can also use one of many

smart shopper

5 questions to ask when you're shopping for a printer:

1. Does the printer use standard SIMMs, or do I have to use SIMMs supplied by the vendor?
2. What is the minimum amount of RAM sufficient to get the maximum resolution from the printer?
3. On average, how many pages will I be able to print before the toner cartridge runs out?
4. Does the printer come with downloadable fonts in addition to the fonts in the printer's ROM?
5. Does the printer have a power-saving mode for when it's not in use?

enhancement technologies to achieve the appearance of higher-quality output. Apple's FinePrint, HP's REt, Lexmark's PQET, and Xerox/Digital's TrueRes manipulate the dots on the paper to make lines and fonts smooth and crisp.

But these resolution-enhancement technologies don't change the appearance of grayscale graphics. Instead, some of the printers use a separate grayscale enhancement to give graphics more levels of gray without sacrificing detail. There are various techniques for enhancing grayscale output, but Apple's PhotoGrade, with the LaserWriter 12/640 PS, and Xanté's XTScreen, with the Accel-a-Writer 8300, produced grayscale quality that impressed our jury.

THE MAC-TO-PC CONNECTION / *PowerPrint*

NO MAC IS AN ISLAND, but sometimes it sure feels like it. For instance, when you're on the road with your PowerBook, finding a Mac-configured printer to use can be difficult — some people resort to sending their documents to a fax machine. If you work in the art department of a business, your department may be the only one that is Mac-centric. And some special-purpose printers simply don't come in configurations for the Mac.

Fortunately, GDT Softworks has a solution. PowerPrint (\$149) lets users connect a Mac to a PC-configured printer by using a serial-to-parallel printer cable and special software

drivers. PowerPrint supports over 1,200 laser, inkjet, and dot-matrix printers. PowerPrint Pro, a network version, is available for \$299.

GDT Softworks is also working on a PowerPC Platform version of PowerPrint. This version will allow users who use the Mac OS on a PowerPC Platform to print to PC-compatible printers. Since the PowerPC Platform will have a parallel connector, this version will come with a parallel cable. It should be available in February 1997.

GDT Softworks, Burnaby, BC, Canada; 800-663-6222 or 604-473-3600; <http://www.gdt.com/>. / ROMAN LOYOLA

DESKTOP DRIVER / revamped LaserWriter 8

APPLE AND ADOBE SYSTEMS have recently revamped their PostScript-printer driver. LaserWriter 8.4.1 PostScript Driver (the latest version at press time) is the long-awaited release; it offers a speed boost as well as many new features.

Interface. Among the new features in the upgrade are the ability to select a printer in the Print dialog box instead of in the Chooser; Page Setup options in the Print dialog box; and the option to use ColorSync profiles.

Printer icons can now be stored in folders instead of having to remain on the Mac desktop, which cuts down on desktop clutter. And a new Printer menu, for viewing and selecting any available printer, is located in the menu bar.

Background Printing. If you printed a 5-MB file with an earlier LaserWriter driver, it would spool a large, compressed file to your hard disk before sending it to the printer. Not only did that waste time but it also required lots of hard-disk space. LaserWriter 8.4.1 solves the problem with a one-pass printing solution: It sends the PostScript code to the printer as it is being processed by the driver. This saves time for monochrome printing, but the real speed difference can be seen with color printing, in which the file sizes often drift

into the 100-MB range.

Background printing is more flexible with the new driver too. You can still set printing to occur in the foreground or background, but now you can also set the print time as well (see figure below). You can set a print job for urgent processing, normal processing, or a specific time and date, or you can place the document on hold.

Speed. Because the new driver is mostly written in PowerPC-native code, your system will probably receive a speed increase of 10 to 15 percent for processing. This won't make the printer itself any faster, but it will reduce your overall printing times.

Before you upgrade to LaserWriter 8.4.1, you should make sure that your applications are compatible with it. You can check this on the Web at <http://www.support.apple.com/> and at <http://www.info.apple.com/>.

Paper Handling. Often overlooked features in a printer are its paper-handling capabilities. If the printer gets a lot of use, then it should have a large paper capacity to reduce the need for user intervention. The Digital

LN17ps and the Xerox DocuPrint 4517mp have ample paper-handling features, including an optional ten-bin mailbox/collator, a duplexing unit, two universal-paper-tray units that can hold a total of 1,000 sheets,

and an envelope feeder. These features are important assets in a busy workgroup environment. Be sure to also check whether the printer supports the paper sizes you need.

Printing on thick paper or on adhesive media can pose a problem for printers that have intricate paper paths. If the paper is thick, it will jam in the printer. Labels peeling off inside a printer can cause damage that would be costly to repair. Straight paper paths, like that of HP's LaserJet 6MP, are the easiest for printing on thick stock and labels.

Printable Area. Printers that output letter-sized (8.5-x-11-inch) and tabloid-sized (11-x-17-inch) documents actually print on an area that's smaller than the physical piece of paper. This is common and should not pose a problem for most business documents. In electronic publishing, there is a need to see the entire letter- or tabloid-sized document to check crop marks and *bleeds*, where printing actually extends beyond the edges of the paper. The four tabloid printers in this review can print letter-sized documents on tabloid paper, and the Xanté printers are capable of printing gatefold prints with an imageable area measuring 11.89 x 24.9 inches.

RAM. Today's PostScript laser printers can operate with a minimal amount of RAM, which means their prices are lower. Printers can compress the information that needs to be processed or can send the information in bands.

We tested the printers with their standard

memory configurations, which were as low as 3 MB on the HP LaserJet 6MP and the Genicom PowerPro 12 and as high as 12 MB on the HP LaserJet 4MV and the Xanté Accel-a-Writer 8200. Generally, the standard amount of RAM suffices, but we recommend upgrading to the printer's next-higher RAM increment — you should notice improvements in processing speed and have more room to temporarily store fonts in the printer instead of downloading them from your Mac. However, be aware that there is a point of diminishing returns when adding RAM to a printer — we would be hard-pressed to think of a situation in which you would need the maximum amount of RAM in order to output a print job.

Output Quality

For our graphics- and text-quality ratings, we assembled a group of desktop-publishing professionals and novices to participate in our jury. We looked at text quality, graphics quality, and overall print quality. Our results showed that all the printers had respectable output.

Regarding text quality, the HP LaserJet 5M received the highest marks, for having crisp, solid text. Even small, 6-point type looked very clean and not too heavy. It was a neck-and-neck race for just about all the other printers, but we found that HP's Resolution Enhancement technology made for superior output. The Genicom PowerPro 12 produced acceptable-quality text, but it was heavier

than the output of the other printers.

Graphics quality was also a close race. While evaluating grayscale images, we looked for even, smooth gradations that had no mars or streaks. The Xanté Accel-a-Writer 8300 proved to be a strong contender in this area, capable of handling subtle shadow and highlight detail. The HP printers produced average graphics quality — we noticed more of a dither pattern with the HP printers than with the others. The Digital LN17ps, the Lexmark Optra Lx+, and the Xerox DocuPrint 4517mp turned out solid output and got above-average grayscale scores from our jury. Output from the GCC Elite XL 616 showed some banding and looked too light overall, with some of the highlight detail blown out.

The Bottom Line

When this crop of laser printers is broken into segments — for personal and small workgroups, small to medium workgroups, and publishing and the graphic arts — the results of our evaluations spell out good news for each group.

The HP LaserJet 6MP is not only inexpensive but is also able to output sharp text and decent grayscale graphics. We highly recommend this printer for personal or small-workgroup use. In the small-to-medium-workgroup segment, we chose the Digital LN17ps. Although it is very similar to the Xerox DocuPrint 4517mp, we found that the extra 2 MB of RAM that comes with the

Digital printer made a difference in our speed tests, and the LN17ps proved to be a strong output-quality contender. And for those who want the best output quality for serious DTP work, we recommend the Xanté Accel-a-Writer 8300. 

Tony Bojorquez is a freelance Mac consultant. MacUser Labs Project Leader Rick Oldano managed the testing for this report.

SOUTHLAND MICRO SYSTEMS...

**We're Strong Enough To Support
All Your Memory Needs.**

Since our inception, Southland Micro Systems has maintained an impeccable record of delivering only the highest quality memory solutions to a sophisticated, memory-hungry marketplace. Our product line includes all capacities of SIMMs, DIMMs, VRAM and Cache for both Macintosh and DOS platforms.

Complete in-house manufacturing allows us to monitor and produce reliable, quality products, bring new products to market quickly, and develop innovative memory solutions to meet the demands of today's ever changing market.

Because of this, we're able to offer our customers competitive pricing, fast delivery, and value added service.

Painter 4

FRACTAL DESIGN PAINTER® 4.0
Painter 4 is the world's leading paint program. With more than 150 unique brushes that simulate traditional painting materials, Painter's rich set of painting tools and special effects empowers your creativity.

NEW FEATURES:

- **SHAPES**—With shapes you can mix bitmap painting and vector illustration. Import artwork created in illustration programs like Adobe Illustrator, Macromedia FreeHand® and CorelDRAW®.
- **MOSAICS**—Paint with mosaic tiles for unique eye popping graphics.
- **WEB**—Painter supports GIF, JPEG and will even create Image Maps and repeating backgrounds.
- **NET PAINTER**—Collaborative networking with Painter.

Nothing comes closer to reality.

**"SuperScan took top honors
in every important performance category"**

Macworld

Check out the monitor Macworld editors voted their "runaway favorite for focus, brightness, contrast, and color."

The SuperScan Mc 21 gives you the sharpest image money can buy (0.22 mm horizontal dot pitch, 0.16 mm vertical). It also displays 40% more pixels than competing aperture grill monitors for crisper graphics and improved readability of small text. Plus it's flatter than other displays so you get a more accurate image with consistent brightness and precise focus even in the corners.

Which Mac?

MacUser went into the Labs to test 38 new Mac systems, to help you figure out which will best fit your needs.

First adopters of the Macintosh will remember the days when *Which Mac?* could be answered with one phrase: **Whichever Mac Apple has released this year. A more recent generation would probably have answered: A color Mac — if you can afford it. And users in the early '90s, when Apple spewed forth new Mac models at an alarming rate, might have remarked: A Performa if it's for home or school; otherwise, get a Quadra.**

Since the arrival of Mac clones, what used to be a simple decision has become as complex and nerve-racking as deciding which combination of deductions will slip by the IRS computer and which will be flagged for an audit.

Ask today's Mac cognoscenti which Macintosh you should buy, and you're likely to hear more questions than answers: Do you want an Apple machine or a clone? What kind of processor do you need — a PowerPC 601, 603e, 604, or 604e? And how about Level 2 cache? Or graphics RAM — 1, 2, or 4 megabytes? Or maybe you want to skip onboard graphics hardware altogether and go with a PCI accelerated-graphics card? Oh, and speaking of PCI . . .

Sheesh.

After years of having the option of buying any Mac you wanted, as long as it was Apple's, an explosion of options has made the Mac buying experience significantly more confusing, and potentially more rewarding, than ever before. It's this overwhelming selection of vendors, models, and configurations that screamed out for a comprehensive guide to

buying the right new Mac OS system for you — this is that guide.

In these next few pages, we'll supply you with all the information you need to make a good buying decision, including the results of the most extensive lab test of single-processor Mac OS systems ever attempted (for our most recent evaluation of multiprocessor systems, see "Muscle Macs, January '97, page 76). We took 38 currently shipping Macs into our labs and examined every aspect of their performance and functionality. For testing, we used the just-released version 4.0 of MacBench, our industry-standard benchmark test suite (see the "How We Tested" sidebar). The results of these tests and our recommendations are presented in this special report.

Our recommendations are based on two assumptions: You know how much money you want to spend, and you know the kinds of tasks you want your Mac to perform. To help narrow your choice, we've divided our discussion into three categories — those for budget systems, priced at under \$2,000 each; those for midrange Macs, which run \$2,000 to \$3,500 each; and those for high-end machines, which cost over \$3,500 each. Within these categories, we recommend the Mac OS system that our tests show is best suited to your needs — whether you're a home user, student, businessperson, publisher, or multimedia designer.

Hopefully, we've distilled all the information you need to decide which Mac you should buy. And even if our recommendations don't jibe with the Apple — or Motorola or Power or UMAX — system of your eye, you'll find comprehensive lab data to help make up your own mind.

What we found may even surprise you.

BY CHRISTOPHER BREEN

The Budget Macs

IT'S REMARKABLE HOW MUCH computer muscle you can purchase for under \$2,000 today. With the release of new generations of PowerPC processors, the "cheap" Mac of today outpaces top-of-the-line models of just a year or two ago. Macs in this price category exhibit surprisingly high speeds — and don't overburden your pocketbook.

The budget Macs ship with at least 16 MB of RAM and a 1.2-GB hard drive. Except for the Apple Power Mac 7200/120, each sports an IDE rather than a SCSI drive and each comes standard with an 8x CD-ROM drive. Most also have at least two PCI slots, a 256K Level 2 cache, and a PowerPC 603e running at a speed between 160 and 200 MHz. Most systems supply 1 MB of RAM for graphics, with Power Computing being the generous exception — the PowerBase models come with 2 MB of graphics RAM.

The UMAX SuperMac C600/180 and C600/200 and the Power Computing PowerBase 180 and 200 are the only under-\$2,000 Mac OS systems that come with upgradable CPU daughtercards. To date, however, no upgrades have been released for these machines, and because of limitations imposed by their logic-board architectures, it's unlikely these machines will ever accommodate anything but a 603e processor. Apple claims that the Performa 6400 models can be upgraded via a simple motherboard swap but so far has not

announced any upgrade plans.

Monitors are sold separately, so be sure to budget \$350 to \$500 for a 15-inch multisync monitor or \$700 to \$1,000 for a 17-inch monitor. Apple Performas, the Motorola StarMax 3000 series, and the UMAX SuperMac C600 series come with 28.8-kbps modems. For an additional \$159, you can add a Global Village 28.8-kbps Platinum modem to the Power Computing models.

Test Results

As for overall processor speed, we found that you get significantly more bang for your buck from products that don't have a rainbow-colored apple on the front. The three Apple machines that fell in the budget price range — the Performa 6360, the Performa 6400/180, and the Power Mac 7200/120 — scored worst in our MacBench 4.0 Processor test. The Performas' low scores can be attributed to their lack of a Level 2 cache — all the clones come with a 256K cache. And although the Power Mac 7200 comes with a cache, its 120-MHz PowerPC 601 simply isn't able to keep up with the faster 603e processors in the other budget-system boxes.

Turning to disk access, an area of interest to DTP and multimedia users, the UMAX SuperMac C600/200 was barely edged out by the Power Computing PowerBase 200 in the MacBench 4.0 Disk test yet flew past the

PowerBase 200 in the Publishing Disk test. An otherwise lackluster performer, the Apple Performa 6360, turned in a Publishing Disk score within the top three.

Due to the ATI accelerated-graphics chip set in the PowerBase 180 and 200, Power's machines fared well in all the graphics tests. This chip set provides an additional benefit unmatched by that of any other Mac — built-in 3-D-graphics acceleration. Gamers choosing a PowerBase can jump into the third-dimension without needing to get a dedicated 3-D-graphics accelerator.

Although performance should be a major consideration for anyone contemplating the purchase of a new machine, it shouldn't be the sole deciding factor — particularly if this is your first Macintosh. First-time Mac buyers need a computer with a solid price/performance ratio as well as one with enough software to be useful the first time they boot up. Except for the Power Macintosh 7200/120, which comes with nothing more than the Mac OS, all the entry-level Macs we examined come with generous suites of software. Common to all are copies of ClarisWorks 4.0, Quicken SE, and the Grolier Encyclopedia. Depending on the vendor, you also receive such useful applications as Now Utilities, Norton Utilities, Symantec AntiVirus, Conflict Catcher 3, Descent, and the America Online sign-up kit.

Bargain Macs for the Budget-Conscious

✓ MacUser BEST BUY

*Test would not run on this system.

■ Best performer in each test.

Listing is alphabetical within groups of equal mouse ratings.

We tested the base configurations of all Mac OS systems available for \$2,000 or less to find out which offered the greatest value. Price was the most important factor in our mouse ratings. When considering performance, we weighted most heavily scores from MacBench 4.0 tests that reflect basic productivity tasks. In

addition, we gave points for including a modem, extra RAM, extra RAM for graphics, built-in Ethernet, bundled software, and an extended warranty.

MacBench 4.0 scores are relative to those of an Apple Power Mac 6100/60 with a 30-MHz memory bus, a 250-MB hard drive, 2 MB of built-in graphics

At Home

Your home Mac will likely serve more than one family member and so must satisfy a variety of needs. Grown-ups who are occasionally compelled to bring work home will want their Mac for word processing and moderate number crunching. When not busy with the toil of the workplace, these same adults will find their computer a handy tool for dealing with family finances and marveling at multimedia CD-ROMs. Younger members of the household will use the Mac to create artistic masterworks destined for the *galerie du réfrigérateur*, do homework, and play games. *Everyone* will use the modem.

Because gaming is so important to the home user, you need a computer fast enough to handle these processor-intensive diversions. You also want a Mac that's easy to set up and use and that includes most of the necessary software and hardware required, right out of the box.

With budget in mind, we expect that you'll buy a 15-inch color monitor. The systems with 1 MB of graphics RAM can display thousands of colors (at 16 bits) on these monitors — plenty for your purposes. With their 2 MB of graphics RAM, the Power Computing PowerBase models can display millions of colors (24 bits) on a 15-inch monitor.

Possessing all those colors won't be much fun unless you have something to print them

on. No home Mac system is complete without a color inkjet printer. Color inkjet printers from such companies as Apple, Epson, and Hewlett-Packard start at around \$300 each.

Because your home Mac will entertain as well as enlighten, you should factor a pair of external speakers into your budget. For \$100 and less, you can add rich sound to your gaming and multimedia experiences. And speaking of gaming, if you or a member of your family is serious about games, purchase a joystick. Quality Mac 'sticks are available for under \$80 each from Advanced Gravis, CH Products, Kernel Productions, and MacALLY. Game pads start at \$29 each.

In School

Times have changed. Computers are now as necessary in the college dorm as calculators once were. The academic Mac is intended for scholarly purposes — writing term papers, doing Internet-enabled research, and accessing CD-ROM source material. But we suspect that your Mac-away-from-home will also be used for less cerebral pursuits — sending e-mail, generating flyers and newsletters, and playing games.

Just how robust your processor must be will depend a great deal on your studies — engineering and science students are likely to require a Macintosh at the top end of the performance scale. Another concern is

Best Budget Mac for Home

Power Computing PowerBase 180 (desktop configuration)

The Power Computing PowerBase 180 isn't the fastest Mac OS system you can buy for under \$2,000 — its MacBench 4.0 Processor score was fourth of the ten systems we examined in this category. But for home users, it offers the most bang for the buck. For just under \$1,500, you get a 180-MHz PowerPC 603e (which can be upgraded to a faster processor), a solid software bundle, an extra megabyte of graphics RAM, and onboard 3-D-graphics acceleration. The one drawback to this system is that you have to pay extra for a modem.

RAM, and no L2 cache. This system is given a score of 100 for all tests. We tested all systems as configured by the vendors but with AppleTalk off and with virtual memory on (disk tests on the Performa 6360, PowerBase 180 and 200, and SuperMac C600/180 and C600/200 were performed with virtual memory off

due to a bug in the Mac OS that conflicts with some IDE-equipped systems). We set the screen resolution to 640 x 480 pixels with a bit depth of 8 bits (256 colors) for all tests except the Hi-Res Publishing Graphics test, for which we set the resolution to 1,152 x 870 pixels with a bit depth of 8 bits (256 colors).

Best Budget Mac for Education

Motorola StarMax 3000/160 DT

Along with the PowerBase 180, we were impressed with the value of the StarMax 3000/160 DT. In its desktop configuration, it costs just under \$1,500, yet it outperformed the higher-priced Apple Performas in our tests. Unlike the PowerBase 180, the StarMax 3000/160 has a modem and a PS/2 port (for those who want to use the less expensive PC keyboards and mice) and a five-year warranty. Regrettably, the StarMax 3000/160 lacks onboard Ethernet. Students requiring Ethernet will need to buy a PCI Ethernet card.

connectivity. Wired institutions are becoming more commonplace, and you'll require Ethernet to make the connection. Students attending schools that don't provide networks in the dorms — or who live off campus — will want a modem.

Student budgets are likely to be the most restricted of any computer user, so the school Macintosh should be both inexpensive and free from repair costs. Because no one can guarantee reliability with any computer, an extended warranty is an important consideration for students. Motorola clones are the only Macs that come with a five-year warranty.

The school user who opts for a low-end Mac will require the same peripherals as those who keep a Mac at home — a 15-inch monitor; a color inkjet printer; and, perhaps, a joystick. Depending on your field of study, you may have to purchase additional, specialized software. Fortunately, college campuses generally offer their students significant discounts on Mac software.

Doing Business

The economical Mac fits nicely into a small-business or work-at-home venture. Not intended for running computer games and interactive multimedia, your Mac will play host to word-processing, spreadsheet, personal-information-management, and finance/accounting packages.

In the business world, time is money, and consequently your Mac should be swift enough to crunch lengthy columns of numbers and sort your contact database in short order — MacBench 4.0's Processor, Disk, and Graphics tests measure how quickly your Mac accomplishes these tasks. With the success of your business comes growth, and you'll want

a Mac that can grow with you. Your computer should be upgradable as well as have enough room to accommodate additional hard drives. And, of course, the cost of your Mac shouldn't plunge your business into the red.

Although you can skip the Ethernet connection if you're not networked, you're likely to require a large monitor to accommodate fat spreadsheets and long client lists. A 15-inch monitor will suffice when you're starting out, but you should anticipate purchasing a 17-inch monitor when your budget allows.

Because the paperless office has yet to be realized, you'll need a printer. Although getting an inkjet printer is a reasonable short-term solution, your documents will have a more professional appearance when printed on a PostScript laser printer — 600-dpi

grayscale PostScript printers start at around \$900 each.

Your business may depend on the integrity of your data, so a reliable backup system is a must have. Budget buyers will find that a medium-capacity, removable hard drive such as the Iomega Zip serves them well for backup purposes. The mail-order price of a Zip drive hovers around \$199. Power Computing also offers an internal Zip drive as a preinstalled option.

Pushing Pixels

You're a small publisher/graphic artist whose Mac must cope with page-layout, illustration, and imaging applications. With the world flocking to the Internet, it won't be long before Web Page Designer appears on your business card as well. You and your Mac must be Internet-ready.

A fully functional desktop-publishing system requires speed, storage, and lots of RAM — factors that do not bode well for the buyer on a budget. Unlike home, school, and business systems for which processing power is helpful but not vital, DTP and imaging demand the most powerful Mac you can afford. In addition to a fast machine, you'll need one with a high-capacity hard drive — graphics files can swallow several megabytes of disk space. Having extra hard-drive bays also benefits DTP users.

If you work in the visual arts, you'll want to be sure you're seeing the whole picture. For this reason, plan to buy at least 17 inches of

Best Budget Mac for Business

UMAX SuperMac C600/180

The SuperMac C600/180 is a smart choice for an office. It's fast enough to tear through most jobs undertaken by business software, has a hard disk large enough to store the numerous files typical of small businesses, won't break your budget, and comes with a modem. But probably the biggest factor for business users is on-site service free of charge for the first year of ownership — a service for which you must pay Power Computing an additional \$49 for one year. Add to this the comfort of being able to buy a SuperMac box from a local dealer instead of via mail order, as you must for a Power machine, and we think you'll agree that the security of knowing support is just around the corner makes the SuperMac C600/180 a best buy for business users.

monitor real estate. You should also add enough graphics RAM — or an accelerated-graphics card — so you'll be able to view your images in 24-bit color regardless of your monitor's resolution.

Graphics programs consume a lot of RAM. Plan to purchase as much RAM as you can reasonably afford. Once your Mac is chock-full, start shopping for an additional high-capacity, fast hard drive.

You'll also need a reliable removable-media drive for archiving huge graphics files. Check with representatives of your favorite service bureau to find out which media they prefer to use.

Best Budget Mac for DTP

Power Computing PowerBase 200 (minitower)

DTP and imaging require a fast computer, and according to our tests, the fastest overall Mac under \$2,000 is the PowerBase 200. Although we tested a desktop system, we recommend the minitower configuration (about \$100 more) because of its greater expandability. The PowerBase 200 is priced right and carries one more megabyte of graphics RAM than nearly all other budget systems, thereby supplying DTP users with more colors at higher resolutions. An added bonus is the ATI 3-D-graphics chip set, which is useful for those wishing to break away from two dimensions.

Buyers will surely want to invest in more RAM and, perhaps, a higher-capacity hard drive than the 1.2-GB drive that comes with the starter configuration of the PowerBase 200. The nice thing about Power is that you can make changes when you order directly from the company and thus can avoid paying for a drive you'll be replacing anyway.

Visible Means of Support

You've carefully read our test results, figured out the kind of processor you want and how many PCI slots and drive bays you need, made a list of RAM and hard-drive configurations, and confirmed the costs. But one vitally important question isn't answered by our tests: What kind of tech support and customer service can you expect after you've made your purchase? Although a Mac OS machine is a fairly utilitarian tool, buying one isn't akin to purchasing a shovel — they don't all work flawlessly year after year. To get your Mac system back on its little rubber feet, companies take different approaches, and it's worth knowing what these approaches are before settling on a particular model. Here's how the various Mac-system vendors shake out:

Apple Computer. If you're shopping for a new computer, one factor in Apple's favor is support. Although many of us have spent far too long on 800-SOS-APPL (Apple's tech-support line), at least Apple has a track record. For better or worse, it's been supporting Macs since day 1, and for the most part, it has an efficient system in place. So far, the clone vendors' support systems are largely untested.

With a new Performa, you get a one-year, on-site service warranty, which means that if Apple determines you have a hardware problem that requires the attention of a technician, it will send a tech to your home or office. As with the clone vendors, this initial diagnosis is made via a call to technical support. Apple's response time has been reported to be three to five days — although months-long service delays, due to parts shortages, were not uncommon for certain Performa and PowerBook models during 1996.

Non-Performa Macs also have a one-year warranty, but all repairs on these machines must be performed at an Apple-authorized service center or dealer. Performa and non-Performa owners have the option to purchase AppleCare, an extended-warranty program for on-site or shop repair. The price of AppleCare depends on the computer model you buy and

how it's configured.

Motorola. StarMax systems are covered by the most generous warranty in the business — five years. The first year is on-site, next-business-day service, Monday through Friday from 8 A.M. to 5 P.M. The second and third year, you must return the computer to one of Motorola's local service depots. During years 4 and 5, the StarMax must be shipped, at customer cost, to the factory for repair. Motorola offers free phone support for problems with the Mac OS only for the first 90 days. Customers can purchase warranty upgrades to same-day service or extend on-site service past the first year.

Power Computing. On-site service is available from the company only if you purchase it separately. This service is available for \$49 for one year, \$149 for two years, and \$199 for three years. Response time for on-site service depends on part availability.

If a user-installable component — such as a keyboard or hard drive — is defective, and Power determines that you're capable of making the exchange, the company will often simply ship the part to you and have you swap it rather than send out a technician. If the problem is more serious and you haven't purchased the on-site warranty, you are required to return the computer to Power and pay one-way shipping costs. Power Computing agrees to return your computer to you via the same shipping method you used — for example, if you ship via Federal Express' second-day service, expect Power Computing to return your clone to you via second-day service from Federal Express.

UMAX Computer. The UMAX tech-support line operates seven days a week from 6 A.M. to midnight (central time), and the company claims that 85 percent of calls are answered in three minutes or less. UMAX includes a one-year, on-site warranty with all its computers and guarantees that a technician will arrive within three business days with the proper part in hand.

The Mac Midrange

WITH A BUDGET OF \$2,000 TO \$3,500, we enter the Macintosh sweet zone. These machines are fast and generally have more memory and graphics RAM and larger Level 2 caches than their sub-\$2,000 counterparts.

Within these budgetary boundaries, you'll find systems sporting up to 32 MB of RAM and hard drives starting at 1 GB and swelling to 2.5 GB. In the Macs we examined, the drives are evenly split between the IDE and SCSI standards — with the Apple Performa 6400/200, Motorola models, Power Computing PowerBase 240, and UMAX SuperMac C 600/240 containing the less expensive IDE drives. The Apple Power Mac 7600/132 and 8500/150, the Power Computing PowerCenter models and PowerTower 180e, and the UMAX SuperMac J700 series have SCSI drives.

At the low end of the midrange-Macintosh price scale, we found 603e processors blazing away at 200 to 240 MHz. At \$2,300 to \$2,800, the PowerPC 604 makes a brief appearance in the Power Computing PowerCenter series as well as the UMAX SuperMac J700/150; PowerPC 604s also sneak into the lower-cost Power Mac 7600/132. At the \$2,300

mark, the powerful 604e processor begins to appear, in Motorola models. All machines we examined that cost over \$3,000 use a PowerPC 604e processor.

When it comes to Level 2 cache, Apple offers only 256K. Happily, most clone makers include a 512K cache once the base price exceeds \$2,300. Power Computing offers a 512K cache even in the low-cost PowerCenter 150, and the high-performance PowerTower 180e has a generous 1-MB Level 2 cache.

Don't expect higher prices to equate with additional RAM. For example, Power Computing places only 16 MB of RAM in its base models, regardless of how expensive the machine is. Apple is equally shy about exceeding the 16-MB barrier with its computers. Motorola is more generous, including 32 MB of RAM in its minitower configurations, but it offers only 16 MB in the desktop boxes. UMAX includes 24 MB in its C600/240 and J700/180 clones but only 16 MB in its less powerful SuperMac J700/150.

Bundled modems are absent on most midrange Mac OS systems. However, onboard Ethernet and upgradable CPU daughtercards

predominate in most lines, save the Motorola clones. Software bundles vary more widely in this category than with the budget Mac OS systems.

Test Results

Once again the scores of Apple's machines in our MacBench 4.0 Processor test were less than stellar. The Power Mac 8500/150, in particular, turned in poor results. Although we're impressed with the audiovisual features built into the 8500/150, we feel that its \$3,000 price is a bit steep. Users interested in these AV features would be better served by looking instead to the less expensive — and slightly faster — Power Mac 7600/132, which, like the Power Mac 8500/150, includes 24-bit composite- and S-video input. Better yet, for a few hundred bucks, they can add a PCI digital-video card to a non-AV-equipped clone.

We were far more taken with three lower-cost systems that delivered high Processor and Disk scores. Base configurations of the Power Computing PowerBase 240 and PowerCenter 150 and the UMAX SuperMac C600/240 cost \$2,200 to \$2,300, yet they performed

✓ MacUser BEST BUY

*Test would not run on this system.

Best performer in each test.

Listing is alphabetical within groups of equal mouse ratings.

Nearly half the systems we tested fell into the midrange category: those with base configurations street priced at \$2,000 to \$3,500 each. We weighted price and performance nearly equally, giving slightly more importance to tests that reflected business tasks than publishing tasks. Systems got extra points for

having a modem; offering more RAM, hard-disk capacity, and graphics RAM; providing built-in Ethernet; having greater expansion capacity, including built-in digital-video capability; and offering a longer-than-usual warranty.

MacBench 4.0 scores are relative to those of an Apple Power Mac 6100/60

as well as some systems priced at \$2,800 — making them reasonable choices for cost- and performance-conscious home, student, and business users. A standout among these clones is the SuperMac C600/240, which includes 24 MB of RAM, a 2.1-GB hard drive, and a modem. The Power Computing systems include only 16 MB of RAM, a 1-GB drive, and no modem.

Despite their comparatively low RAM and graphics RAM, the 604-based PowerCenter 166 and 180 provide the best value for midpriced systems. Both machines edged out the Motorola StarMax 4000/160 MT in all tests except the Publishing Disk and Floating Point tests. The Power Computing products also offer a significant advantage over Motorola's — their processors can be upgraded, whereas the StarMax series' cannot. Shoppers whose budgets prevent them from exceeding the \$3,000 limit should look carefully at the PowerCenter models.

Skipping to the high end of this category, we were impressed by the performance of the Power Computing PowerTower 180e. Its Processor score was 16 percent higher than that

of its closest competitor, the UMAX SuperMac J700/180. Clearly demonstrating that processor speed isn't the only factor you should consider when judging a computer's performance, MacBench 4.0 showed the 180-MHz PowerTower's processor subsystem to be roughly 19 percent faster than that of the 200-MHz Motorola StarMax 4000/200s. The higher score can be attributed to both the larger Level 2 cache in the PowerTower 180e — 1 MB versus 512K — and the 180e's faster system bus. The PowerTower 180e also turned in admirable graphics scores — scores that will translate into better Photoshop performance, zippier text redraws in QuarkXPress and PageMaker, and better throughput for desktop audio and video applications.

At Home

Home users who spend over \$2,000 for their Macs should have something more serious in mind than balancing their checkbooks. Home video productions, digital audio, 3-D dabbled, or hard-core gaming may all be good justifications for breaking the household budget. But because this is a home computer,

Best Midrange Mac for Home

Power Computing PowerBase 240 (desktop configuration)

We said budget was a concern, and we weren't kidding. Although one of the least-expensive midrange Macs, the PowerBase 240 scored in the middle of the pack in terms of overall performance. As with the other PowerBase models, you get an upgradable processor, 2 MB of graphics RAM, built-in 3-D-graphics acceleration, and a solid software bundle. Downside? Midrange-Mac buyers will have to add a modem and more RAM to be truly happy.

with a 30-MHz memory bus, a 250-MB hard drive, 2 MB of built-in graphics RAM, and no L2 cache. This system is given a score of 100 for all tests. We tested all systems as configured by the vendors but with AppleTalk off and virtual memory on (disk tests on the SuperMac C600/240 and the PowerBase 240 were

done with virtual memory off due to a bug in the Mac OS that conflicts with some IDE-equipped systems). Screen resolution was 640 x 480 pixels with a bit depth of 8 bits (256 colors) for all tests except Hi-Res Publishing Graphics, for which resolution was 1,152 x 870 pixels with a bit depth of 8 bits (256 colors).

we assume that cost is still a concern.

If you're considering home multimedia production you'll need a fast processor; at least 32 MB of RAM; and a high-capacity, fast hard drive. Desktop-video enthusiasts will be tempted by the built-in video capabilities of the Power Mac 7600/132. If your aspirations move beyond the limits of the 7600, you'll need to look into getting a dedicated video card.

It's time to upgrade your monitor to 17 inches, and if you intend to work or play in the third dimension, you'll appreciate having a 3-D-graphics-acceleration card — provided your computer doesn't already offer 3-D acceleration.

If you're contemplating a midrange purchase because you want to squeeze just a few more frames out of *Marathon Infinity* and *MechWarrior 2*, you're a serious enough gamer to consider a top-end joystick from ThrustMaster or CH Products. Need to take pictures of the kids? Think about a digital

Best Midrange Mac for Education

UMAX SuperMac C600/240

The SuperMac C600/240 comes close to the perfect Mac for higher education — if it just contained an Ethernet connection and its graphics RAM could be expanded beyond 1 MB, we'd be completely sold. The base model ships with a modem, a high-capacity hard drive, and 8 MB more RAM than the slightly faster PowerBase 240. In addition, this upgradable clone's minitower case sports four drive bays. Although you could configure the PowerBase 240 with the same case and accoutrements as the UMAX machine, doing so would raise the price to hundreds of dollars more than the SuperMac C600/240.

camera. Prices start at around \$400 and range up to \$900 for consumer-model cameras. If that's too expensive, have the kids sit in front of your Mac and use a Connectix Color QuickCam (around \$180).

In School

It would be more than just a little shortsighted of us to assume that everyone who attends college is an undergrad who uses a computer for such simple tasks as word processing and Internet access. Macs on campus perform the same kinds of chores as are carried out in the workplace and, therefore, must be just as vigorous. However, because these machines are being purchased by students — or their parents — cost counts.

Students investing in a midpriced Mac are likely to be involved in science, engineering, graphic arts, music/audio, video production, or multimedia design — disciplines that demand the most from a computer. Applications that address these fields generally consume large amounts of RAM and storage. You'll need a Mac with RAM and hard-disk space to spare. As with any college Mac, yours should have a modem and, if possible, Ethernet. Depending on the kind of applications you use, you may also require a monitor larger than 15 inches.

If you're starting from ground zero, you'll need the same peripherals as other students — a printer; external speakers; and, if you like, a joystick. Because your studies are likely to be a bit more focused, you'll add devices appropriate to your interests. These may include a digitizing tablet, MIDI interface and synthesizer, video card, digital camera, or scanner. Because it's unseemly for graduate students to claim that the Mac ate their homework, you should consider an inexpensive removable-media drive for backup.

Doing Business

With a midpriced Mac, you can conduct business in earnest. In your hands, you'll have the power to crunch mounds of numbers, design and execute multimedia business presentations, administer an office network, fax and e-mail thousands of clients, and catalog and cross-reference a large inventory. Fortunately, most of these jobs aren't processor intensive and a Mac capable of doing your work needn't break the bank.

Like your home- and school-based colleagues, you'll be happier with more RAM and a high-capacity hard drive. If your business

Best Midrange Mac for DTP and Multimedia

Power Computing PowerTower 180e

You need the fastest Mac you can find, and in the under-\$3,500 market, this is it. The PowerTower 180e scored among the leaders in seven of our eight MacBench 4.0 tests — taking first place in the Processor, Disk, and Lo-Res Publishing Graphics tests. These scores translate into solid overall speed, quick disk access, and fast screen redraws.

Multimedia producers will be pleased with the performance of the 2-GB AV drive; desktop publishers who don't currently need graphics acceleration should be pleased with the 2 MB of onboard graphics RAM. DTP and multimedia users will want to up the machine's wimpy RAM allotment. Although the unit we tested had 32 MB, Power's base configuration comes with 16 MB of RAM.

is doing well enough to afford one of these computers, expansion may be in your future. You'll definitely want an upgradable processor. And if your Mac is joining others in a workgroup, get an Ethernet connection.

Finally, it's likely that your needs will have grown beyond the capabilities of the bundled software. Clone vendors are beginning to offer special bundles that include business-oriented packages such as Microsoft Office. Be sure to check out these bundles.

Of course you need a fax/modem, but what to do when you need to fax a hard-copy document? Right, you need a scanner. For those on a tight budget, Visioneer's PaperPort Vx (around \$300) is an adequate solution for grayscale scanning of hard copy. Quality color, single-pass scanners can be had for \$600 and up each.

Pushing Pixels and Moving Pictures

Unlike home, academic, and business users who find their midrange Macs blazingly fast, many graphic designers and multimedia producers will discover that these models do little more than make their work tolerable. No more overnight vigils while your Mac cogitates over large rendering jobs; an end to extended coffee breaks while an underpowered computer applies a processor-intensive Photoshop filter; and finally, digital-audio tracks to spare when you use DECK II.

For most of your work, priority 1 is to secure the fastest processor your pocketbook allows — a 604e is a must. You'll also want to give your Mac as much RAM as you can afford. And because graphics, audio, and video files can be very large, expect to increase the capacity of your hard drive. For those involved in the audio/media world, hard-drive capacity and speed are crucial. To stream large audio and video files seamlessly from your Mac, you'll require a fast AV hard drive.

Consider future expansion, and find a Mac

Best Midrange Mac for Business

Power Computing PowerCenter 166

If ever there were a modern-day counterpart to the venerable Mac IIci — the classic business Macintosh — this is it. There's nothing terribly fancy about the PowerCenter 166. No overabundance of RAM and no bundled modem. But it turned in a solid, midrange score in our MacBench 4.0 Processor test, exhibited more than adequate performance in our disk and graphics tests, has an upgradable processor, has Ethernet, and is not expensive.

with plenty of drive bays. If you're involved in video production, a RAID array is in your future and these extra bays will help. Not only will your desk be tidier with the array tucked away, because you can run it from the fast internal SCSI-2 bus, you also save the cost of the Fast-and-Wide SCSI-2 PCI card necessary to run an array externally.

Plan on a 17-inch multisync monitor with enough graphics RAM to provide 24-bit color

at every screen resolution available to you. If you want these millions of colors as well as optimal graphics performance, investigate an accelerated-graphics card.

Both DTP and multimedia require a removable-media drive with room to spare. The \$500 Iomega Jaz offers 1 GB of removable storage for around \$100 per cartridge. More-expensive, optical drives can store 2.6 GB of data per cartridge.

How We Tested

Evaluating the relative merits of Mac OS systems is a daunting task, now that more than 40 models are available for users to choose from. In pursuit of this goal, we logged hours of hands-on time with every single-processor model of Mac and Mac-compatible on the market in the U.S. To determine the new mouse ratings reported here, we conducted extensive system-performance

testing and considered pricing, bundled hardware and software, and warranties and service.

Our ratings are based on the new 4.0 version of MacBench, the industry-standard benchmark for measuring Mac OS-system performance. We're particularly proud of the new graphics tests in MacBench 4.0, which replay verbatim the graphics calls made by

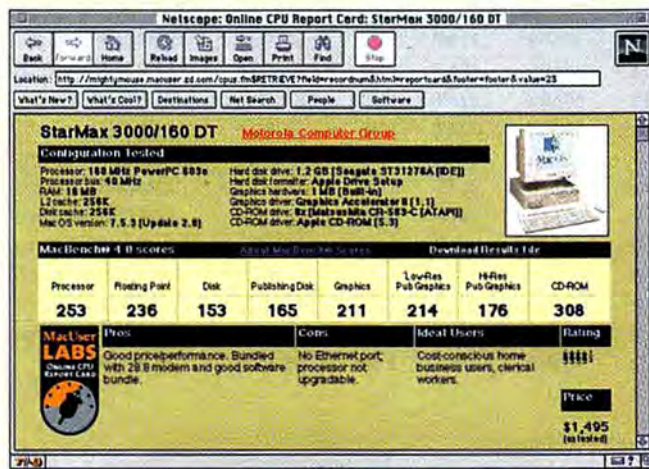

11 top-selling Mac applications that ZDBOp (Ziff-Davis Benchmark Operation) profiled during development of MacBench 4.0. These new tests make it look as though the profiled applications are actually running on your Mac.

In this system roundup, we have provided basic system-configuration information for each model we tested and a complete set of the key MacBench 4.0 scores. But we realize that with the fast-changing pace of today's Mac-clone market, you also need up-to-date information about the latest models, configurations, and pricing changes. That's why we have also instituted MacUser Online CPU Report Cards as a major feature of our Web site (see figure).

If you've seen our report cards before, you probably already know what a valuable resource they are when it comes time to purchase that new Mac you've been saving up for.

If you haven't taken a look yet, you owe it to yourself to check them out. Even if you're an experienced report-card watcher, we encourage you to take another look: In response to your requests, we've enhanced the report cards to include more of the information you've asked us for about system features and configurations. And, of course, we've posted a complete set of new MacBench scores and mouse ratings, based on the evaluations we did for this report.

As in the past, we remain committed to maintaining our online report cards as the most comprehensive, up-to-date resource for comparative Mac OS-system shopping available anywhere. In essence, the MacUser Online CPU Report Card database is like an ongoing Which Mac? lab report that's always up-to-date and just a mouse click away. / HENRY BORTMAN

MacUser's Online CPU Report Cards are one of the most often-accessed features of our Web site. They provide instant access to performance, pricing, and hardware- and software-bundling information about all shipping single-processor Mac and Mac-clone systems. We routinely post information about new systems as soon after they ship as possible. Go to <http://www.zdnet.com/macuser/cpu.html>.

• To obtain a MacBench 4.0 CD-ROM (shipping and handling fee, \$5 U.S., \$6 Canada, or \$7 international), fax credit-card information to 919-380-2879 or send a check to Ziff-Davis Benchmark Operation, 1001 Aviation Parkway, Suite 400, Morrisville, NC 27560.

• You can also download MacBench 4.0 from the Web at <http://www.zdnet.com/zdbop/>, but without the CD-ROM, you won't be able to run the graphics or CD-ROM tests.

The Ultra Macs

CONSIDERING THE BUCKS you'll be dishing out for these systems, you have every right to expect the kind of bang that rattles windows and causes cows' milk to sour. These high-octane machines deliver, and they do so with the PowerPC 604e exclusively. Speeds of these 604e processors begin at 180 MHz, with the Apple Power Mac 8500/180, Power Computing PowerTower Pro 180, and UMAX SuperMac S900/180, and peak at 225 MHz, with Power Computing's PowerTower Pro 225 and UMAX's SuperMac S900/225.

As is typical of all Power Computing base models, the PowerTower 200e and PowerTower Pros ship with 16 MB of RAM each, whereas the Apple Power Mac 8500/180 and 9500/200 and the UMAX S900 series each have 32 MB. What they lack in RAM, the Power Computing clones make up for with their 1-MB Level 2 cache. The UMAX SuperMac S900s and the Apple Power Mac 9500/200 have 512K caches, whereas the Power Mac 8500/180 has a paltry 256K cache.

The PowerTower Pro series sports 8 MB of graphics RAM on the bundled IMS TwinTurbo graphics card. The SuperMac S900 series ships with this same graphics card, although the card in the SuperMac S900/180 and S900/200 has only 4 MB of RAM. The Power Macintosh 9500/200 also comes with

an accelerated-graphics card, a 2-MB version of the ATI Xclaim GA.

All hard drives in the base-model configurations in the high-end-Mac category have a capacity of about 2 GB each. For those who just can't get a fast enough storage system, the PowerTower Pro can be configured with RAID arrays of either 4 or 8 GB each.

Having enough PCI slots shouldn't be a problem with most of these models either. Except for the Power Mac 8500/180 and the

PowerTower 200e (which contain three PCI slots), all these computers come with six slots. At this price point, all Macs have built-in Ethernet (10BASE-T and AAUI), a fast internal SCSI-2 bus, and upgradable processors (the UMAX SuperMac S900 series offers a multiprocessor upgrade option).

Test Results

Those who have expressed concern that Apple will be unable to compete with clone makers

Best High-End Mac for Business

Power Computing PowerTower 200e

Like its sibling the PowerTower 180e, the PowerTower 200e turns in some mighty dazzling numbers. In our MacBench 4.0 Processor test, it was third overall — edging out the more-expensive-by-about-\$750 PowerTower Pro 200 and coming almost to within a single percentage point of the \$4,995 PowerTower Pro 225. It has an upgradable CPU daughtercard, should you later feel the need for additional speed, and has enough drive bays to accommodate another hard drive or two.

The base configuration of this clone needs some extra RAM, but you can easily add this.

✓ MacUser BEST BUY

■ Best performer(s) in each test.

Listing is alphabetical within groups of equal mouse ratings.

To find which systems best fit the needs of users at the high end, we tested all Mac OS systems available for a street price of \$3,500 or more. In this category, performance counted most. We paid particular attention to the MacBench 4.0 Processor, Publishing Disk, and two Publishing Graphics scores. In addition,

we gave points for expandability, extra RAM, graphics RAM, and hard-drive capacity, and built-in digital-video capability when deciding a system's mouse rating.

MacBench 4.0 scores are relative to those of an Apple Power Macintosh

in regard to value for dollars may have a point. Once again, one of Apple's products turned in poor numbers in our price/performance comparison. The Power Mac 8500/180, although a capable multimedia computer, came in dead last in the Processor test for this price category. The overall fastest midrange Power Computing PowerTower 180e outsourced the 8500 in every test except the Publishing Disk and CD-ROM tests. Note, however, that the 8500 provides video inputs whereas this capability can be added to the PowerTower 180e only via an optional video card.

The Apple Power Mac 9500/200 didn't fare much better. In the Processor test, it outsourced the like-priced Power Computing PowerTower Pro 180. However, it just barely squeaked by the less expensive UMAX SuperMac S900/200 in the Processor test and, in this same test, lagged more than 11 percent behind the Power Computing PowerTower 200e. Considering that the PowerTower Pro 180 and the SuperMac S900/200 have substantially more graphics RAM than the Power Mac 9500 — 6 and 2 MB more, respectively — and that the PowerTower 200e costs \$450 less than the Power Mac 9500, it's hard to recommend the Apple product to shoppers seeking the best performance or price.

The low end of the over-\$3,500 Mac OS

systems is competently held down by the UMAX SuperMac S900/200 and S900/180. These clones come configured with an accelerated-graphics card and 32 MB of RAM and turn in reasonable MacBench 4.0 scores, given their cost. They were bettered by the Power Computing PowerTower 200e in our Processor test but outshone the latter in the disk and graphics tests. DTP and multimedia users who can't stray much above the \$3,500 mark should take a close look at the UMAX machines.

Once you're over the \$4,000 hurdle, Power Computing rules the roost. Power was the first vendor to offer a Mac OS system with a 225-MHz 604e processor and is still the only vendor to offer an optional RAID array. The value of Power's high-end configurations is reflected in high Processor, Disk, Publishing Disk, and Graphics scores — scores that will be of vital interest to DTP and multimedia users who have deep pockets.

Doing Business

High-end machines are too powerful to be used for word processing alone. You'll want one of these systems only if you're the kind of person who demands the absolute pinnacle of power from a computer. And what will you be able to do with this power? Whip

Best High-End Mac for DTP

UMAX SuperMac S900/200

If you need to reel in a capable system for under \$4,000, check out the SuperMac S900/200. For \$3,795, you get a Mac that outperforms

Apple's top-of-the-line Power Mac 9500/200 and offers graphics acceleration, a fair chunk of RAM, Ethernet, a load of PCI slots, and four drive bays. One additional bonus: As with the Power Mac 9500/200 the SuperMac S900/200 can become a multiprocessor machine with the addition of a CPU card. So far, Power Computing has not announced this capability for its computers.

If price isn't an issue, consider the PowerTower Pro 225. There's not a faster non-RAID system on the market, and you'll love the number of drive bays, six PCI slots, and the 8 MB of graphics RAM on the IMS TwinTurbo accelerated-graphics card.

6100/60 with a 30-MHz memory bus, a 250-MB hard-disk drive, 2 MB of built-in graphics RAM, and no L2 cache. This baseline system is assigned a score of 100 for all MacBench tests. We tested all Mac OS systems as configured by the vendors but with AppleTalk turned off and with virtual memory turned on. We

set the screen resolution to 640 x 480 pixels with a bit depth of 8 bits (256 colors) for all MacBench tests except the Hi-Res Publishing Graphics test, for which we set the screen resolution to 1,152 x 870 pixels with a bit depth of 8 bits (256 colors).

GO TO <http://www.zdnet.com/macuser/0397.html#mac>

out a full-blown multimedia presentation in nothing flat, jockey numbers in massive spreadsheets, teleconference, create glorious Web sites, sort hundreds of thousands of client files, touch up a photograph in the corporate quarterly report . . . to be honest, there's very little you can't do.

Fortunately, you'll get by quite comfortably without ever visiting the top end of this category's price scale — no need to cancel the company picnic to pay for your fast Mac. Typical business users don't need the kind of performance that comes with graphics acceleration, RAID arrays, half-a-dozen PCI slots, and screaming-fast processors. Given a reasonable amount of RAM — 32 MB at least — a high-capacity hard drive, and enough graphics RAM to provide you with 24-bit color, you should be in hardware heaven.

What more could you want? You have the laser printer, the scanner, the fax machine, the DAT drive for backup, the computer-controlled messaging and speakerphone system, the massive monitor, the QuickCam teleconferencing kit, the ISDN line, and a rather comfortable chair. What's missing? A PC.

It's a Windows-centric business world, and you're going to look mighty silly if you can't run company-created custom DOS and Windows applications. However, there's no need to taint your desktop with a DOS box. Purchase a PCI DOS card from Apple, Orange Micro, or Reply.

Best High-End Mac for Digital Video

Power Computing PowerTower Pro 225/RAID

You wanted the fastest Mac on earth, and this is it. You can purchase a RAID array with any of the PowerTower Pro series — configured either with 4 or 8 GB. Our MacBench 4.0 Disk and Publishing Disk scores shot through the roof once we added an array to the PowerTower Pros, and this is the kind of performance you want if you're producing professional video. Naturally, you'll want a hefty amount of RAM to complement your array. How much would it cost to max out one of these babies? Power Computing will ship you a PowerTower Pro 225/RAID with 512 MB of RAM for a scant \$11,280 (not including sales tax and shipping).

Pushing Pixels

Now you're at the top of the game. Whereas the moderately priced Macs are competent tools for design, the top end can be a delight. To justify the purchase of a Mac costing over \$3,500, you should be creating far more than the family newsletter. Your ultra Mac is perfectly suited for complex-graphics rendering, vast page-layout documents, professional photo retouching, CAD, and 3-D modeling.

Because you're in the "to heck with price, give me performance" bracket, 2 MB of graphics RAM just won't cut it. You need an accelerated-graphics card. As with any DTP professional, you'll want a wicked-fast hard drive. And to accompany the fast processor and hard drive, plan to add dozens of megabytes of RAM.

If you don't have a 21-inch monitor, now's the time. With 4 to 8 MB of graphics RAM, your accelerated Mac will be able to throw millions of colors onto a screen this size.

At the top end, loads of costly add-ons for DTP professionals are available. Thankfully,

graphics service bureaus have the really pricey ones — slide scanners, drum scanners, plotters, and high-quality color laser printers — in-house. However, you'll still need a high-capacity storage device for transporting your files to the bureau.

Moving Pictures

Unfortunately, video and multimedia professionals will discover that their over-\$3,500 Mac is just the beginning of a more expensive (and expensive) system. Much of your real work will be performed by pricey add-on peripherals such as video cards, digital-audio systems, and CD-ROM writers. Your Mac can do its part, however. To accommodate these devices, you require lots of processing power, lots of PCI slots, lots of drive bays, lots of RAM, and lots of fast hard drives working together in an array. For you, budget is superfluous. You need the fastest Mac on earth.

As to add-on peripherals, a sympathetic loan officer would be a good start.

The Verdict: Apple Falls Behind

REVIEWING OUR RECOMMENDATIONS, one glaring trend emerges — when one considers price versus performance, Apple products never win out against cheaper, faster Mac clones. Although we owe a huge debt of gratitude to Apple for bringing us the Mac in the first place, the truth is that Mac OS systems currently offered by Apple are not competitive — clone makers simply offer better systems for less money. We hope that when we address this issue later this year, Apple's name will again appear in our list of endorsements.

Odd, isn't it? We gathered together 38 Mac OS systems ranging in price from \$1,495 to \$6,950. We used MacBench 4.0 — the finest diagnostic tool at our disposal — to poke, prod, and probe each and every machine. We sat

through endless meetings and pored over reams of spec sheets in order to hash out which features are likely to appeal to which type of user. And we ran extensive value-analysis spreadsheets to help back up what our guts told us about each system we examined. All to answer this one question, Which Mac should you buy?

The results are in at last, and the answer is bound to be a Mac without an Apple logo.

Contributing Editor Christopher Breen would like to thank the staff of MacUser Labs for telling him which clone . . . er, Mac, he should buy. MacUser Labs Senior Project Leader Kristina De Nike managed the testing for this report.

Everyone who wants to **save big** on removable storage, raise your hand.

Low-cost, high-capacity storage is always within reach with the SYS.230™ Personal Storage System.

That's because it packs up to 230 MB onto a single rewritable-optical cartridge that costs only \$10.* Compared to the price for any of today's magnetic removables, there's simply no comparison. And unlike magnetic removables, rewritable-optical media is almost indestructible. Which means you never have to worry about data loss due to dust, magnetic fields, shock — or even airport security.

Save 230 MB
for just \$10!

Plus, you can take the Universal SYS.230 System with you anywhere and use it with whatever you want. It's small enough to slip into the palm of your hand, and it's the only portable solution that works as both a SCSI and a parallel device. So you can use it with your laptop and your desktop, your Macintosh or your PC.

All of which makes the SYS.230 System perfect for storing and transporting images from the Internet, your digital camera or scanner — or for any other data-intensive application.

Why not join the millions who already rely on rewritable-optical storage? Call **800-347-4027** today for more information about the SYS.230 Personal Storage System.

Because if you'd like to save big in more ways than one, we have to hand it to you.

OLYMPUS
OPTICAL CO., LTD.

The SYS.230 Personal Storage System can be purchased through the following resellers: CDW (800-334-4CDW), MacWarehouse (800-255-6227), MacZone (800-248-0800), MicroSystems Warehouse (800-660-3222) and PrePress Direct (800-443-6600). Resellers, call Ingram Micro (800-456-8000), Optical Laser (800-776-9215) or TechData (800-237-8931).

*When purchased in package of five at suggested retail price of \$49.95. SYS.230 is a trademark of Olympus Optical Company, Ltd. All other brand or product names mentioned herein are trademarks or registered trademarks of their respective holders. ©1996 Olympus Optical Co., Ltd.

The Best of '96

The 12th Annual *MacUser* Editors' Choice Awards

Half empty? Or half full?

*Record losses. Turmoil at the top. The cancelation of Copland.
Or: A record comeback. Firm new leadership. A fresh OS vision.*

NINETEEN NINETY-SIX was a year in which the pessimists argued with the optimists about who were the realists. Today, as the *MacUser* Editors' Choice Awards turn 12, our money's with the optimists.

Our argument can be found on the next few pages. Therein you'll see that the Mac marketplace remains richly innovative, chock-full of powerful products, and animated by a force essential to every thriving enterprise: competition.

This spirit of competition not only mobilizes Mac developers — it also surfaced at the *MacUser* editorial offices as we underwent our annual ritual of argument, wrangling, and — let's admit it — internecine one-upmanship that precedes the editors-only vote for the best products of 1996.

Here are the results of those deliberations: the 1996 *MacUser* Eddy Awards. As you read about these exciting new products — winners and finalists — you may well be inspired to fill that half-empty or half-full glass to the rim and raise it in a toast. Drink up! The Mac is back.

By Rik Myslewski and the editors of *MacUser*

Breakthrough Technology of the Year **BeOS**

The BeOS is everything the Mac OS isn't: fast, reliable, and stable. It can perform 2, 3, 4, 10, or 20 things at once, barely pausing to catch its breath. It rarely crashes, but when it does, only one application "goes south" — not the whole machine. It delivers what the now-canceled Mac OS replacement, Copland, once promised. And more.

Now that the BeOS has been ported to run on Power Macs and Mac clones, Mac users have an alternative to the Mac OS — an alternative that shows just how shaky the foundations of the Mac OS truly are. For pointing the way to what the Mac could do if it had a better OS foundation, we award this year's Eddy for Breakthrough Technology to the BeOS.

Desktop Publishing and Graphics

the Web and beyond

ALTHOUGH INTERNET EVANGELISM may continue to dominate the popular press, Mac-savvy professional publishers — and the companies that supply their tools — have already integrated Web-page design into their day-to-day creativity. This year, the Web is no longer uncharted territory — it's merely another place where Eddy Award-winning products can strut their stuff. Whether your creativity is bound for the page, the screen, or the Web, you can rely on such powerful software as the exceptionally capable Macromedia FreeHand 7. Adobe Photoshop users should add not only PhotoTools 2.0, Extensis' powerful type tool, to their plug-in arsenal but also the prepress-expert-on-a-disk, ScanPrepPro 3.1, from ImageXpress. And no professional pixel pusher should ignore such award recipients as the Minolta RD-175 megapixel digital camera or the high-resolution Xanté Accel-a-Writer 8300 printer.

DESIGN TOOL

Extensis PhotoTools 1.0

Extensis — \$99

A sleek interface adds unsurpassed text-handling capabilities to Adobe Photoshop.

FINALISTS

BeyondPress 2.0.4

Astrobyte USA — \$595

The best XTension for QuarkXPress users who want to create graphics-rich Web pages.

Specular 3D Web Workshop 1.0

Specular — \$249

All the ingredients you need to make unique Web-page graphics and animations.

DEVELOPMENT TOOL

BBEdit 4.0.1

Bare Bones Software — \$119

Simply the best professional Web authoring environment, bar none.

FINALISTS

CodeWarrior Gold 10

Metrowerks — \$399

Now Java support has been added to this industry-standard compiler and development environment.

UserLand Frontier 4.1

UserLand — freeware

A fast, powerful — and free — alternative to AppleScript; now with CGI-writing capability.

GRAPHICS

APPLICATION

Macromedia FreeHand 7

Macromedia — \$599

A dynamite drawing package that sets new standards of elegance and power.

FINALISTS

Adobe Illustrator 6.0

Adobe Systems — \$595

A solid upgrade to a solid product makes this powerful package a professional necessity.

Canvas 5

Deneba Software — \$595

If you have room — or time — for only one graphics program, this jack-of-all-trades is a good choice.

GRAPHICS RESOURCE

Mountain High Maps 2.1

Digital Wisdom — \$695

Extensive layers and masks add unprecedented usability to this elegant map package.

FINALISTS

Grammar of Ornament, Professional Edition

Direct Imagination — \$199

A gorgeous presentation of Owen Jones' multicultural classic of ornamental design.

Visual Language Library: Antique Celestial Maps, Volume III

Visual Language (distributed by Image Club Graphics) — \$169

Elegance and beauty suffuse this lovely collection of celestial and astrological maps.

MAC OS SYSTEM

Power Computing PowerTower Pro 225e RAID

Power Computing — \$5,230 and up

The first system to outperform not only Apple's best but also anything the Wintel world had to offer.

FINALISTS

Apple PowerBook 1400

Apple Computer — \$2,499 and up

The most feature-rich, flexible, and reliable PowerBook to date — and the first to sport a CD-ROM drive.

DayStar Genesis MP 720+

DayStar Digital — \$8,499 and up

This multiprocessor system provides the ultimate in high-performance computing for demanding graphics professionals.

Power Computing PowerBase 240

Power Computing — \$2,195 and up

Accelerated graphics and 3-D graphics, plus a 240-MHz processor, put this system in a class by itself.

UMAX SuperMac C600/240

UMAX Computer — \$2,295 and up

Great performance, reasonable pricing, and a good bundle make this system a winner for retail buyers looking for a choice.

MONOCHROME PRINTER

Xanté Accel-a-Writer 8300

Xanté — \$4,995

The ideal choice for desktop publishers who need high-resolution (1,200-dpi), full-bleed tabloid laser printing.

FINALISTS

Apple LaserWriter 12/640 PS

Apple Computer — \$1,689

Fast and reliable, the perfect printer for small to midsized workgroups.

Hewlett-Packard LaserJet 6MP

Hewlett-Packard — \$1,149

Excellent output quality distinguishes this small-office/home-office printer from the rest of the pack.

PAGE-DESIGN APPLICATION

Adobe PageMill 2.0

Adobe Systems — \$149

Powerful frame- and table-creation capabilities extend the power of this Web authoring tool.

FINALISTS

Clarix Home Page 1.0

Clarix — \$99

A surprisingly powerful yet easy-to-use entry-level Web authoring tool.

UniQorn 1.1

SoftPress Systems — \$895

By incorporating Java and QuickDraw GX, this Web authoring tool goes where HTML fears to tread.

PRODUCTION TOOL

ScanPrepPro 3.1

ImageXpress — \$695

This plug-in is the perfect complement to a scanner and Photoshop — it's like having a prepress professional to advise you on every image-processing decision.

FINALISTS

Font Box 2.0.2

Insider Software — \$79

The most effective way for publishing professionals to keep their fonts well organized.

PhotoGIF 2.1

BoxTop Software — \$45

No Web-page author should be without this powerful GIF-conversion tool.

PROFESSIONAL DIGITAL CAMERA

Minolta RD-175

Minolta — \$9,995

Three-CCD design provides image quality never before seen in an under-\$10,000 camera.

FINALISTS

Kodak Digital Science Professional DCS 410 Camera

Eastman Kodak — \$7,995

A hard-working camera for the day-to-day needs of imaging professionals.

ScanView Carnival 2000S

ScanView — \$29,995

Versatile usage options and exceptional image quality.

SCANNER

Agfa DuoScan

Agfa — \$5,500

An innovative design with two scanning beds provides quality reflective-art and transparency scanning in one space-saving unit.

FINALISTS

Epson Expression 636

Epson America — \$899 and up

Epson's ongoing series of affordable flatbed scanners just keeps getting better and better.

Howtek Scanmaster 2500

Howtek — \$15,900

Precision hardware coupled with exceptionally powerful professional software for large-format, flatbed scanning.

Software Product of the Year

Adobe PageMill 2.0

In 1996, a slew of competitors arrived to take on Adobe PageMill 1.0, the WYSIWYG Web-page-creation standard. Adobe responded with version 2.0, an upgrade that erased any doubt about the ability of the company to retain its leadership position in this competitive arena. Not only does PageMill 2.0 make it easy for average users to become Web publishers but it also provides powerful tools for HTML veterans. The creation of complex layouts via the use of tables and frames was a difficult and time-consuming task for even the most well-versed Web authors, but with this version of PageMill, it's a piece of cake. In addition, the program's native support for Netscape plug-ins makes it the tool of choice for creating and previewing multimedia-rich Web sites.

Business

a bean counter's dream

ALTHOUGH THE MAC may be better known for its strengths in graphics and desktop publishing, it continues to please savvy bean counters who understand the benefits of a computing platform that's easy to maintain, simple to use, and low in training costs. Among this year's Eddy Award-winning business-software packages are Claris' powerful, easy-to-use FileMaker Pro 3.0 database manager; BestWare's M.Y.O.B. 6.0 for small-business accounting; and Microsoft Internet Explorer Starter Kit 2.1, our choice as the best Internet browser for the Mac. The In Focus LitePro 220 presentation projector and the superbly engineered MicroNet DataDock 7000 RAID array are examples of elegant Mac hardware that's comfortable in any business setting.

COLOR PRINTER

Tektronix Phaser 350

Tektronix — \$3,495

Forget color laser printers — this speedy solid-ink printer will meet all of your business-printing needs.

FINALISTS

Apple Color StyleWriter 2500

Apple Computer — \$349

A solid inkjet performer equally suitable for the home or the small office.

Epson Stylus Color 500

Epson America — \$279

Not only is its output sensational but this inkjet printer is also bundled with a wealth of software goodies.

COMMUNICATIONS PRODUCT

Trancell WebRamp IP Router

Trancell Systems — \$899

An elegant multifunction eight-port hub and router that demystifies ISDN and Ethernet.

FINALISTS

RNS DataShuttle ISDN 256/PCI

RNS — \$1,695

A fast, efficient ISDN card with exceptionally easy-to-use setup software.

Timbuktu Pro 3.0 for Macintosh

Farallon Communications — \$139

Seamless remote control of just about any computer, using just about any communications protocol.

CONSUMER DIGITAL CAMERA

Olympus D-200L

Olympus America — \$599

A brilliant balance of image quality and ease of use at an affordable price.

FINALISTS

Fuji Fujix DS-220

Fuji Photo Film U.S.A. — \$1,200

Beautiful, ergonomically effective design coupled with a highly productive feature set.

Kodak Digital Science DC50 Zoom Camera

Eastman Kodak — \$1,000

A solid performer designed to exceed the needs of image-conscious business users.

CROSS-PLATFORM PRODUCT

Reply DOS on Mac Card — PCI (Pentium)

Reply — \$1,395

Ignore Apple's offerings — this is the card to get if you need a Wintel machine inside your Mac.

FINALISTS

PC MACLAN 6.0

Miramar Systems — \$169

This PC-to-Mac network-connectivity utility is easy to install and intuitive to use.

uShare 4.1D for Apple Network Server

IPT — \$995 (5 users)

Easy-to-use Chooser-level access from your Mac to an AIX-based Apple Network Server.

DATA-MANAGEMENT APPLICATION

FileMaker Pro 3.0

Claris — \$199

The best general-purpose Mac database-management application just keeps getting better.

FINALISTS

DeltaGraph 4.0

DeltaPoint — \$195

There's no better way to explain reams of data than by using this comprehensive charting package.

Panorama 3

ProVUE Development — \$395

This client/server database couples astonishing speed with powerful scripting capabilities.

DISPLAY PRODUCT

In Focus LitePro 220

In Focus Systems — \$7,499

Never has a bright, sharp LCD projector been easier to use — or sounded so good.

FINALISTS

Mitsubishi Diamond Pro 91TXM

Mitsubishi Electronics America — \$1,699

The most recent monitor incorporating Mitsubishi's DiamondTron technology is the sharpest ever.

Proxima Lightbook Projector

Proxima — \$4,999

Full-size performance from a lightweight, easy-to-use, portable LCD projector.

INTERNET-ACCESS APPLICATION

Microsoft Internet Explorer Starter Kit 2.1

Microsoft — \$25

This fast browser edges out the competition with its elegance and responsiveness.

FINALISTS

Eudora Pro 3.0

Qualcomm — \$89

Simply the best Internet e-mail client.

Netscape Navigator 3.0

Netscape Communications — \$49

Still the pioneer in bringing multimedia capabilities to the World Wide Web.

INTERNET SERVER APPLICATION

NetCloak 2.0.1

Maxum Development — \$195

Provides unprecedented control over how your Web site appears.

FINALISTS

RushHour 1.1

Maxum Development — \$295

Turbocharges graphics-file delivery from your Web server.

Tango for FileMaker

EveryWare Development — \$349

This full-featured CGI provides a development environment for creating and serving FileMaker databases over the Web.

NETWORKING PRODUCT

Apple Network Server 700

Apple Computer — \$16,299

If only Apple's desktop systems were as elegantly designed as this fast and competitively priced AIX-based file/OPI/Internet/database server.

FINALISTS

NetDoubler 1.2.2

Asanté Technologies — \$99

No savvy network administrator should fail to install this file-transfer-acceleration software.

RunShare 2.0.2

RUN — \$399

Every prepress shop will benefit from this utility's large-file-transfer acceleration.

REFERENCE PRODUCT

Select Phone 1997 Edition

Pro CD — \$99

An exceptionally versatile search engine complements this collection of 1 million U.S. phone numbers.

FINALISTS

Bookshelf 1996-97 Edition

Microsoft — \$55

This handy one-CD reference work combines a dictionary, thesaurus, world atlas, encyclopedia, almanac, dictionary of quotations, and much more.

Cinemanía 96

Microsoft — \$35

Over 25,000 movie reviews, enhanced by clips, quizzes, stills, and biographies, all Internet-updatable.

SMALL-BUSINESS-ACCOUNTING APPLICATION

M.Y.O.B. 6.0

BestWare — \$140

A single-user package, loaded with flexibility, that's a joy to use.

FINALISTS

Big Business 2.0

Big Software — \$199

This multiuser package is strong in reporting and security and includes an HTML online-catalog creator.

QuickBooks Pro 4.0

Intuit — \$119

As you'd expect from a Quicken sibling, this single-user package is both powerful and easy to use.

STORAGE PRODUCT

MicroNet DataDock 7000

MicroNet Technology — \$3,499 and up

Phenomenally well engineered, easily upgradable — everything you've ever wanted in a RAID system.

FINALISTS

FWB Hammer SledgeHammer•Pro

FWB Hammer by StreamLogic — \$3,679 and up

Differential-by-design engineering ensures exceptional speed from this array.

Panasonic KXL-D742

Panasonic Computer Peripheral — \$399

Compact, battery-powered, and engineered to be your PowerBook's perfect traveling companion.

Hardware Product of the Year

Apple Network Server 700

The most elegantly engineered computer that Apple has ever built isn't a Mac. The operating system isn't even the Mac OS — it's a version of IBM's UNIX operating system, AIX. Don't let that difference put you off, though — the Apple Network Server 700 is actually easier to upgrade and maintain than any Mac, and all the components — from fans to drives to power supplies — are hot-swappable, for no-downtime fixes and upgrades. This solidly designed computer, complete with a road-tested operating system behind it, is an excellent choice for an Internet, OPI, or file server. C'mon, Apple — let's see some of this sophistication migrate to the desktop.

Multimedia

Mac in motion

THERE'S AN EXCELLENT REASON why the Mac continues to be the content-creation platform of choice among creative professionals: From 3-D and animation packages to authoring applications and desktop-video enablers, the Mac has the best collection of multimedia tools, bar none.

ANIMATION APPLICATION

Adobe After Effects 3.1

Adobe Systems - \$1,995

A powerful and indispensable animation and special-effects package.

FINALISTS

ElectricImage Broadcast

Electric Image - \$2,995

Hollywood-quality tools at a desktop-video price.

FutureSplash Animator

FutureWave Software - \$250

Brighten your Web page with quick-downloading vector-based animations.

DESKTOP-VIDEO PRODUCT

Data Translation Media 100 Whole Deal

Data Translation - \$22,990

Excellent image quality and QuickTime integration distinguish this top-flight hardware/software bundle.

FINALISTS

Avid Technology MCXpress 1.0

Avid Technology - \$14,995

Powerful hardware teamed with a highly evolved editing interface.

Truevision TARGA 2000 RTX

Truevision - \$10,995

High-quality, QuickTime-native, dual-channel, Motion-JPEG desktop-video card.

GRAPHICS/VIDEO CARD

miro miromotion DC20

miro Computer Products - \$799

The undisputed price/performance leader in the consumer-level digital-video arena.

FINALISTS

IMS Twin Turbo 128M8

Integrated Micro Solutions - \$899

Impressive performance and excellent value distinguish this 8-MB graphics card.

Radius ThunderPower 30/1920

Radius - \$1,399

Super-resolution graphics combined with 30-bit color accuracy.

INTERACTIVE-AUTHORING APPLICATION

mTropolis 1.1

mFactory - \$1,195

Elegantly flexible, professional-quality multimedia-authoring software.

FINALISTS

Director 5.0

Macromedia - \$929

A host of improvements distinguishes version 5.0 of this popular authoring tool.

QuarkImmedia 1.0

Quark - \$995

Approaches multimedia authoring completely from a print-publishing perspective.

MULTIMEDIA UTILITY

Movie Cleaner Pro 1.3

Terran Interactive - \$189

An invaluable QuickTime-compression tool for novices and experts alike.

FINALISTS

Berserk 1.0 for After Effects

DigiEffects - \$289

Unique, compelling effects with pro-quality precision at a far lower price than competing packages.

MovieFlo' 2.02

The VALIS Group - \$699

Excellent morphing and mesh-distortion tools for creating eye-popping effects.

MUSIC/SOUND PRODUCT

LOGIC Audio 2.5.4

EMAGIC - \$799

Everything the Mac music pro needs can be found in this powerful package.

FINALISTS

Cubase 3.0 VST

Steinberg North America - \$399

This MIDI-sequencer/digital-audio/note program stands out for its unique real-time effects.

Digital Performer 1.7

Mark of the Unicorn - \$895

Stunning pitch-transposition effects and the most elegant interface in the Mac music arena.

3-D APPLICATION

Fractal Design Detailer 1.0

Fractal Design - \$449

Take the guesswork out of adding texture maps to 3-D models by painting on them.

FINALISTS

Bryce 2

MetaTools - \$249

Easily sculpt virtual worlds with this fast, feature-rich upgrade to the popular terrain-creation software.

Infini-D 3.5

Specular - \$649

Impressive upgrade to an already well rounded 3-D-animation-and-design package for novices and graphic designers.

John J. Anderson Distinguished Achievement Award

Steve Capps

In a year when the continued viability of the Mac OS has been brought into question, one fact remains clear: the superiority of the Macintosh interface. That's why we're honoring Steve Capps, codesigner of the Finder and much of the Mac's graphical user interface — the basis of all interface innovation for the last decade. Steve continued to refine the Mac OS interface through the '80s, when he joined the Newton Group to help design the Newton OS. He was also chief architect of Newton 2.0, which revitalized the PDA and led to its much wider acceptance.

After Hours bringing it all back home

IT WAS A GREAT YEAR for those millions of users fortunate enough to have a Mac at home. More CD-ROMs, more games, more children's educational software, more productivity tools and add-on hardware — all in all, everything you need to make a MacHouse a MacHome.

CHILDREN'S SOFTWARE

Trudy's Time & Place House

Edmark — \$40

A spunky little alligator named Trudy leads an exceptionally inventive adventure in geography, mapping, and time.

FINALISTS

Africa Trail

MECC — \$48

Do Africa in this CD-ROM adventure based on an actual 12,000-mile bike trek.

Logical Journey of the Zoombinis

Broderbund — \$40

Twelve sets of math and logic puzzles help save the adorable Zoombinis and guide them to a safe new home.

DESKTOP DIVERSION

Kai's Power Goo

MetaTools — \$49

This wacky image-distortion tool will have you singing the American Breed's "Bend Me, Shape Me" as you do just that.

FINALISTS

Gryphon Bricks

Gryphon Software — \$39

All the fun of Lego creativity with no risk of stepping on those damn plastic blocks.

The Residents' Bad Day on the Midway

Inscape — \$50

Tour a repellent-yet-fascinating carnival and learn the sordid pasts of its denizens.

DOCUMENTARY PRODUCT

Critical Mass: America's Race to Build the Atomic Bomb

Corbis — \$49

An exemplary combination of vivid storytelling and satisfying exploration of 1940s Los Alamos.

FINALISTS

Robert Winter's Crazy for Ragtime

Calliope Media — \$49

A well-designed exploration of ragtime and its importance to American culture.

Volcanoes: Life on the Edge

Corbis — \$49

Stunning photographs enhance the wealth of volcano lore in photographer Roger Ressmeyer's adventure.

GAME

Warcraft II: Tides of Darkness

Blizzard Entertainment — \$55

Enjoy brutal medieval warfare in this addictive, fast-paced, networkable strategy game.

FINALISTS

Marathon Infinity

Bungie — \$35

The ultimate Mac shoot-'em-up adds new levels and map and shapes editors.

X-Wing Collector's CD

LucasArts Entertainment — \$49

The Mac's best flight simulator/arcade game lets you fly multiple space fighters on over 100 missions.

INPUT DEVICE

Logitech Cordless MouseMan

Logitech — \$69

What a mouse should be: smooth, programmable, and cordless.

FINALISTS

Connectix Color QuickCam

Connectix — \$299

This remarkably affordable color-video camera captures compact digital images.

Logitech TrackMan Live!

Logitech — \$149

Light, programmable, radio-controlled mouse for remote-control presentations.

PERSONAL ORGANIZER

Quicken Deluxe 7

Intuit — \$60

Interface updates make this top personal-finance software easier than ever to use.

FINALISTS

Claris Organizer 2.0

Claris — \$70

A well-integrated calendar and contact manager with innovative search tools.

Now Up-to-Date & Contact 3.6

Now Software — \$70

This network calendar and contact manager shares schedules and e-mail addresses.

UTILITY

RAM Doubler 2

Connectix — \$60

Double or triple your apparent RAM safely and effectively without slowdown.

FINALISTS

Now Utilities 6.5

Now Software — \$89

An already impressive suite of productivity enhancements adds an improved Startup Manager.

QuicKeys 3.5

CE Software — \$119

This upgrade lets you create macros that perform most tasks with one keystroke.

Derek Van Alstyne Rising Star Award

Aaron Giles

Aaron Giles' young career has affected two hot Mac markets: the Internet and games. While attending Cornell University, he created several Internet freeware tools; helped develop MacMosaic; and created JPEGView, which won a prize in the '94 Apple Cool Tool competition. Aaron's career as a game programmer began when, after discovering that LucasArts' Rebel Assault wasn't PowerPC-native, he wrote a patch and distributed it free on the Net. LucasArts responded not by suing him but by hiring him to convert its titles to the Mac.

RDC-2

Hear what you see.

Capture images
with sound

Capture images
in motion

multimedia digital camera

Easy to hold yet
small enough to
fit in your shirt
pocket.

RDC-2 Digital
Camera with
optional flip-up
LCD monitor.

- **High Resolution** 768 x 576 Pixel Images captured in 24-bit color utilizing a 410,000 pixel CCD.
- **2MB Built-In Memory** stores up to 38 images in economy mode.
- **PC Memory Card** support lets you store hundreds of images.
- **Dual Lens Design** utilizes a wide-angle 35mm and telephoto 55mm lens, as well as macro optics for close-up photography.
- **LCD Monitor** (optional) allows you to view images before and after you capture them.
- **Fully Automatic Features** like Autoflash, Autofocus, and Autoexposure make picture taking effortless.

Five ways to capture

High Resolution, Sharpness and Color Accuracy...

That's what you need to capture a quality image with a digital camera. The RDC-2's advanced design supports these requirements, as well as offering exciting features that let you go beyond just taking stills. Now you can bring your images to life by capturing the movements and sounds of your subjects.

Still Mode captures high res images in vivid 24-bit color. Exclusive macro capability lets you take pictures as close as 1cm away.

Document Mode utilizes a sharpening filter to capture razor-sharp images of text and graphics.

Still with Sound Mode allows you to take a picture while recording 10 seconds of digital sound.

Sound Mode uses the RDC-2's built-in microphone to record pure digital sound in 8-bit, 11kHz WAVE file format.

Continuous Shooting records the movements of your subject in 1 second intervals. Play back as QuickTime or AVI files. (Requires use of PC cards to transfer data to your computer.)

DESKTOPmedia

Here's your guide to the new QuickTime VR's lofty, if rocky, peaks.

By Jeffy Milstead

Virtual Vistas

I F YOU WANT TO TRY your hand at QuickTime Virtual Reality, now may be the time. As you read this, a new version of Apple's QTVR software, chock-full of new features and Internet potential, has hit the market. Version 2.0 supports 3-D sprites, live QuickTime movies, stereo sound, and an open API for intrepid developers. You can even turn QTVR panoramas into image maps for the Web.

QTVR (<http://qtvr.quicktime.apple.com/>) may be hotter than ever, but it's still not cheap or easy to use. The obtuse command-line parameters in version 1.0 (which made less geeky folks shudder) remain, even though version 2.0 does do away with a hardware dongle, requires less RAM, and works faster.

Take heart. Even if you're not a programmer, all that is cool about QTVR can be yours with just a little time, patience, money, and technique. In this article, we'll start you on the road to QTVR confidence by walking you through the making of a basic panorama.

Anatomy of a Panorama

Imagine you're on vacation and really want to shoot the sweep of the Grand Canyon around you. You could do it with your regular camera

— just turn through 360 degrees, and take several shots as you go. But later, when you're home trying to tape the shots together, you'll notice that the rocks at the edges don't quite line up.

QTVR authoring tools correct such distortion by warping images and "stitching" them together into one long PICT file. Then, to create the digital bubble of the QTVR environment, the software "dices" the photos into quickly displaying tiles and compresses them into QuickTime-movie format. When you move around with your cursor in the completed movie, the QTVR software dewarps the images so that you pan smoothly around the scene. You can look at 360 degrees as if you were standing in the center of a room, spinning on your heels.

Making Your Panorama

STEP 1: Get Your Gear Together. As you start to gather your equipment (see the "Equipment Checklist" sidebar), your first big decision will be what camera and lens to choose. In theory, you can use anything, but in fact, these are the choices that will make life easier or harder.

The basic factors that will affect your decision are the importance of image quality, how

much time and money you want to spend on processing images, and how much scripting you're willing to do. (As you'll see in step 4, making a QTVR scene can involve a lot of scripting if you stray from recommended setups.)

If image quality is king in your world, then you'll want to use an analog camera. Regular cameras still take *considerably* better photos than digital ones. But if your material is destined for the Web, a digital camera is probably fine.

On the other hand, digital cameras will save you the time and money you'd have to spend on developing and scanning pictures. Also, you can buy QTVR pan and tilt heads designed specifically for a few of them, such as the Kodak Digital Science DC40 and the Apple QuickTake 150. However, you have no control over exposure, few lens options, and limited storage. The QuickTake 150 can store only 16 images at its highest-quality setting.

If you use a regular camera, you might have trouble renting a 15mm lens, which is recommended but which is also rare and expensive. The alternative is a cheaper, more common lens, such as a 28mm. This lens has a smaller field of view, so you'll have to shoot more

photographs to capture the entire panorama, 18 instead of 12. In the end, this means more photos to develop and scan, more processing time, more RAM, and a larger resulting file.

As for scripting, the software we suggest you use, the freeware Sanity SaVR, comes with premade scripts for a few camera/lens combinations, including a regular camera with a 15mm lens, a QuickTake, and a QuickTake with a Kaidan wide-angle lens. Using one of these setups will save you time you'd otherwise have to spend writing scripts and calculating rig adjustments by hand.

STEP 2: Set the Scene. Even if your photographic prowess is limited to documenting the family barbecue, you can still successfully produce a QTVR panorama by following a few guidelines (see figure 1).

In general, make sure the camera rig (the entire assembly: the camera, the tripod, and the bracket that holds them together) is level at all times during the shoot. If you forget to check frequently, you'll probably end up having to fine-tune the placement of your photos during the normally automatic stitching process.

Next, make some adjustments to your rig to line up the optical center of your camera (where the image comes into focus) directly over the rig's pivot point. You want the optical center of your camera to be the "nodal point" your panorama will spin around. Stand in front of the camera to make sure the center point of the lens eye lines up with the center of the rig. You'll need to get out a measuring tape to check that the center point is not slightly off to the left or the right.

Next, make sure the nodal point isn't too far backward or forward. The camera's optical center is closer to the center of the lens tube than to the center of the camera body. If you

figure 1 / Whatever gear you use, follow these simple guidelines to set up and shoot QTVR scenes like a pro.

don't adjust for this, you'll get a distortion called parallax error, which makes objects change position relative to each other as your camera pivots. To make this adjustment, look through the camera's viewfinder and line up two vertical objects, such as the side of a building and a distant tree, on the left side of the frame. One should be close to you and the other in the distance. Then pivot the camera until both objects are on the right side of the frame. Watch to see if the two objects change their position with respect to each other. Adjust your camera by pushing it backward or

forward over the pivot point of the rig until the movement is minimized.

The QuickTake and other point-and-shoot digital cameras don't have through-the-lens viewing, so determining the nodal point takes a lot of trial and error. Fortunately, one of the QTVR-rig manufacturers, Kaidan, supplies nodal-point settings for its custom brackets for the QuickTake and the Kodak Digital Science DC40.

STEP 3: Shoot Your Panorama. It's important to be well organized and meticulous during the actual shoot. Since you'll accumulate dozens of images, keep notes so you won't need to take time later hunting for the right picture.

Take the shots in sequence, from left to right — the order the stitching software (the "stitcher") expects them to be in.

A general guideline for lighting and exposure is to aim for evenly lit shots with similar exposure. The stitcher does an amazing job of blending images that have various exposures, but it can't work miracles. If one shot is much brighter than the next, you may end up with a dark band where the pictures overlap. You'll have the easiest time outdoors in strong overhead sunlight or under a reflective blanket of clouds.

In theory, shooting the 12 or more pictures

Equipment Checklist

Here's what you'll need to get started with QuickTime VR. The equipment can be costly, so we've included price ranges for each piece to help you plan. You can rent photographic equipment in most cities.

- ▶ Apple's QuickTime VR Authoring Tools Suite 2.0. \$395.
- ▶ Sanity SaVR, an unsupported utility available over the Web. Free.
- ▶ A reasonably fast computer (preferably a Power Mac) with a minimum of 30 MB of RAM allocated to the QTVR application. \$2,000 to \$6,000.
- ▶ A camera: either a standard 35mm with ASA 400 film or a digital camera. Each brings a different set of choices to the QTVR process. \$300 to \$900.
- ▶ If you use a standard camera, a rectilinear lens,

smaller than 50mm — preferably 15mm. \$550 to \$2,000.

- ▶ A sturdy tripod with a pan/tilt head and two built-in spirit levels. \$150 to \$450.
- ▶ A bracket that will allow you to adjust and turn your camera. You can make your own from an L bracket and a twin camera plate or purchase one from a QTVR-equipment manufacturer. \$100 to \$600.
- ▶ Image-editing software, such as Adobe Photoshop. \$300 to \$1,000.

Why 7 out of 10 people choose Family Tree Maker™

#1 Selling and Best Value

Why should you choose the program 7 out of 10 family history enthusiasts choose? Quite simply, Family Tree Maker's huge community of users and vast database of genealogy records will help you find your ancestors. And this award-winning program gives you the best variety of beautiful printouts.

Find Your Ancestors Fast

Unlike other family tree programs, Family Tree Maker actually helps you find your ancestors. Just click the FamilyFinder™ button to search a list of 115 million people from centuries of genealogy records. You'll instantly learn where to find more information about possible ancestors. And, if a distant relative has already traced your family tree, you may find it on one of the accessory CD-ROMs that work with Family Tree Maker. In fact, we have the world's largest collection of actual family trees and genealogy records on CD-ROM. Save precious time while tracing your family tree from the comfort of your home!

Join a Huge Community of Users

We've sold nearly one million copies of Family Tree Maker. And thousands of those users visit our Web site every single day. Just click the Online button from inside Family Tree Maker and you'll be on the Internet, too. Once there, use

our FREE matching service to quickly find others working on your same family tree. Create a FREE Web page for your family. Or post a FREE classified advertisement seeking family information. If the Internet contains information about your family, we'll help you find it fast!

Create Heirloom-Quality Family Trees

Family Tree Maker makes it rewarding and fun to preserve your family history for future generations. The program stores literally any kind of information. Start with names, dates, and basic facts. Record cherished family stories. Include photos and video clips, too. Then, choose from a variety of attractive printouts to share with your family—beautiful family trees, family journals, scrapbooks, and more.

Let Family Tree Maker Help YOU

Don't miss the chance to preserve your family history before more time slips away. Order today! Or find Family Tree Maker at a software store near you. Satisfaction guaranteed.

*According to PC Data, Reston, VA, 7 out of 10 people buy Family Tree Maker over other family tree programs (Jan-Jun 1996). Available now for Windows 3.1 & Windows 95. Macintosh version available early 1997. Features vary according to platform and price. Accessory CDs sold separately. © 1996 Broderbund Software, Inc. All products are trademarks of their respective holders. Source Code 532

Call us at 1-800-474-8696 or visit www.familytreemaker.com

that comprise a panorama takes a short time. But between rotating the rig, checking that everything is level, and shielding for glare, you'll be lucky if the scenery hasn't changed very much between the first and the final photo. You may wish you could scare off the tourists who walked by in the distance in shot #6, but it's really changes close to the camera that'll require touch-up in Photoshop later.

STEP 4: Set Up the Software. The QTVR authoring toolkit is built around MPW, the Macintosh Programmer's Workshop. As its name implies, it's made to be friendly to programmers, not average folk. Everything that happens inside MPW — and hence the QTVR authoring environment — is driven by a script. Those experienced with scripting will feel immediately at home; those who aren't should set aside some time to learn.

After installing both the MPW and the QTVR authoring environments, double-check that the tools (such as dice and msnm) are in the Tools folder of the MPW Shell application.

Next, seek refuge from the un-Mac-like face of the authoring tools in a very helpful utility called Sanity SaVR. Although this is an unsupported, beta AppleScript application not included with the QTVR authoring kit, it represents the direction the QTVR tools are headed. You'll appreciate Sanity SaVR's efforts to tack a much needed graphical user interface onto the QTVR tools (see figure 2). The 1-MB download is available over the Web at http://solutions.apple.com/pub/quicktime-vr/Goodies/Sanity_SaVR/Sanity_SaVR.html.

STEP 5: Get Your Images Together. After you've shot your scenes and installed the authoring tools, bring the images into the computer.

If you've used a regular camera, you can scan your negatives with a desktop slide scanner, but most QTVR veterans hand this task off to a film developer that processes Photo

CD discs. This not only saves you time but also lets you take advantage of the QTVR software's premade scripts for Photo CD images. Make sure you tell the Photo CD developer to turn off automatic exposure compensation during the scanning process.

STEP 6: Stitch, Dice, and Make Your Movie. Once you have your scans together, you're ready to make your panorama.

Sanity SaVR comes with settings for a few camera setups. Choose the appropriate one in the dialog box by using the pull-down menu at the top. Then select your destination folder and the source folder containing your pictures. To avoid error messages, it's a good idea to keep your source and destination folders on the desktop and within the folder hierarchy so that you avoid hitting the 63-character pathname limit. Finally, click on the Make Pano button and let Sanity SaVR take over.

Sanity SaVR generates a text script based on the information you've supplied it, instead of making you create the script by hand. It then feeds this script to a program called ToolServer (which you downloaded with Sanity SaVR), which activates the individual tools in the QTVR authoring kit one after another.

If all goes as planned, a finished QTVR file (see figure 3) will appear in a few minutes in your destination folder.

STEP 7: Stitch Fixes and Fancy Moves. Of course, everything doesn't always go as planned. There may be times when you want to interrupt the sequence of QTVR tools to make some adjustments to your pictures or the stitch before the final panorama is completed.

Most commonly, you may want to get a look at the long PICT file, or SrcPict (source PICT), the stitcher creates from your individual photos. Even if the stitcher has done a great job, you might want to remove glare (or those tourists) from the image in Photoshop.

In such a case, edit the script Sanity SaVR created by cutting out the final two steps (dicing the stitched PICT file and making the movie). Paste those steps into a separate SimpleText file so you can use it later. Drag the edited script file onto the ToolServer icon, and the script will activate only the tools you've specified, stopping when the photos have been

combined as a PICT file. Open and edit it in Photoshop, but make sure you rotate the image back to its original orientation before saving, if necessary. When you're done, drag the script containing the steps you omitted onto the ToolServer icon to finish the job.

Other times your images may stitch poorly and you'll have to tweak them yourself (the culprit is usually a poorly aligned rig). To fix a really bad stitch, you need to use the stitcher's interactive mode. Your pictures will appear on the screen one at a time, and you

figure 3 / Using your cursor (the circle at this picture's base), you can navigate 360 degrees of a completed scene. Check this scene out online at http://www.zdnet.com/macuser/mu_0397/gu/gu01.html.

use the keyboard to move each one up, down, left, or right. You can shrink or stretch the left edge of the image vertically or horizontally. Pressing the Return key locks the image in place and loads the next image.

Scaling Beyond the Basics

Now that you've got the basics, there's plenty more you can do. You can create complex QTVR worlds made up of multiple scenes linked together or turn your panorama into an image map for the Web. You can also learn how to make an "object movie," a different type of QTVR movie that lets you turn and examine an object with your cursor.

We've mapped out a few great places where you can find out more about QTVR in the bar at the top of each page of this article. Remember, the QTVR learning curve can be a tough climb, but you'll discover the coolest stuff when you reach the summit. ☺

Jeffy Milstead is a senior project leader at MacUser Labs. His New Year's resolution is to be able to calculate the field-of-view parameters for new camera/lens combinations while reciting the alphabet backward.

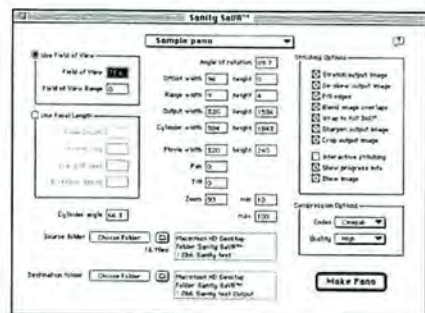

figure 2 / The free, unsupported utility Sanity SaVR adds a friendlier interface to the scripting-based QTVR authoring environment.

What *was* on your PowerBook?

"Losing" your PowerBook is a harsh blow, no question about it. But what's even worse is losing all your files.

Hardware can be replaced, but you may never recover your data. Not to mention all the time and energy invested in creating those files.

There's only one real solution—regular and reliable backups. And if it wasn't so hectic every time you got back into the office you'd remember to do it. Instead you just keep your fingers crossed and hope that today is not the day when you lose everything.

Wouldn't it be great if every time you plugged your computer into the office network, it would get backed up without you even thinking about it?

That's why you need Retrospect Remote.®

Just plug your computer into the network and Retrospect Remote's unique Backup Server™ automatically goes to work. Backup Server patrols your network looking for Macintosh, Windows 95, and Windows NT computers in need of backup. Then it backs them up in priority order—the one with the oldest backup gets backed up first. This simple innovation makes backups conform to your schedule—and everyone else's, too.

For more information on how you can protect your productivity, call 1-800-982-9983 for your free white paper on mobile computing.

Because even if your computer checks out, your data is always checked in.

It's unanimous. MacWeek says Retrospect is "the best of the breed." MacWorld writes "Retrospect leaves the competition in the dust." And MacUser reports "no other backup utility can match its breadth or depth."

If you're not on a network, we still have you covered with our single user version, Retrospect 3.0.

CIRCLE 28 ON READER SERVICE CARD

Making Color Management Fly

Precise previews can guarantee your design isn't full of hot air.

INEXPENSIVE BUT ACCURATE previews are key if you'd rather not spend the money on making something twice. Boeing used QuickTime Virtual Reality to show the 777 to customers before a single airplane was made. Architects routinely construct buildings on-screen before a shovel ever hits the dirt. After all, it's a lot easier to redraw lines a client dislikes than to move bolts or repaint.

No matter how big or small the object you're designing, you can make your Mac work for you too. But the first obstacle to the creation of realistic previews — whether you're using fabrics, tiles, paints, wood finishes, or metals — is color. The trick is not to just eyeball shades on-screen but to also measure light readings from real materials in order to build yourself a reliable color palette.

Color-measurement devices, or spectrophotometers, such as the \$1,295 Colortron II, from Light Source Computer Images, or the \$1,345 Digital Swatchbook, from X-Rite, measure the spectral data of any reflective object and transfer it to the computer as color information. This color information is very accurate, but you need to calibrate your monitor for it to be useful for on-screen design. Check your Adobe Photoshop or spectrophotometer manual for calibration instructions.

In this example, we use a Colortron II, fabric samples, and Adobe Illustrator to design our hot-air balloon, named the *Vaporware*. The same steps can guarantee realistic color even with less lofty projects.

Brian P. Lawler is a graphics and printing consultant in San Luis Obispo, California.

5. GET YOUR DESIGN OFF THE GROUND

STEP BY STEP

1. TAKE COLOR SAMPLES FROM YOUR SOURCE MATERIAL. Use the spectrophotometer to measure your materials' color. Watch out for thin fabric or pale colors that can throw off your readings. For our balloon, we used a Colortron II to measure nylon swatches supplied by the balloon manufacturer. The swatches were made of fabric so thin that the Colortron picked up the color of the table underneath. Sometimes placing black or white paper behind a material can help, but in this case, white paper made the readings too light and black paper made them too dark. Our solution was to fold the fabric several times. To measure difficult materials, you may need to use something such as the Colortron software's average function. You can take measurements from various angles and average them to get a more accurate reading.

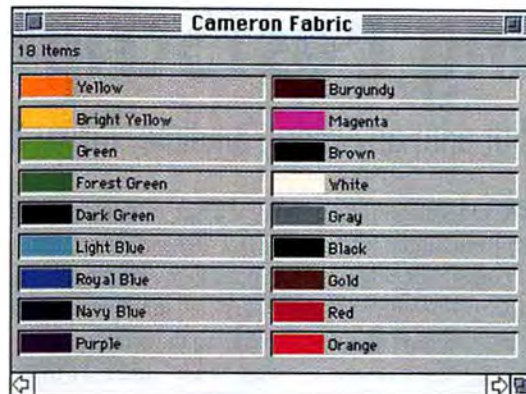

2. BUILD A COLOR PALETTE BY USING THE READINGS FROM YOUR MATERIALS. While measuring your materials, build a collection of colors for use in your project. As with most spectrophotometers, the Colortron's software saves captured digital color information as EPS files called Palettes that can be imported into applications such as QuarkXPress and Adobe Photoshop. We built a palette from our balloon swatches and then imported it into Adobe Illustrator (File: Import Styles).

3. EXPERIMENT WITH YOUR COLORS IN A GRAPHICS PROGRAM. Once you have your palette, it's time to go about the business of design. Our manufacturer gave us an Illustrator file of the balloon's construction to work with. If you aren't so lucky, you'll need to draw or render your object from scratch. Using Illustrator's paint-bucket tool, we created several

1. TAKE COLOR SAMPLES FROM YOUR SOURCE MATERIAL.

2. BUILD A COLOR PALETTE BY USING THE READINGS FROM YOUR MATERIALS.

3. EXPERIMENT WITH YOUR COLORS IN A GRAPHICS PROGRAM.

4. CHECK AND COMPARE THE PROTOTYPES WITH MATCHPRINT PROOFS.

balloon prototypes by applying colors to the panels in different patterns. To get a good idea of how a design will really look, sometimes you need to experiment with more than one view of the object. In our case, we had trouble imagining our 75-foot-tall aircraft in flight, so we ended up using a snapshot of a balloon at a different angle to supplement the view our manufacturer supplied. We scanned the new photo, redrew it in Illustrator, and tried our color schemes on it as well.

4. CHECK AND COMPARE THE PROTOTYPES WITH MATCHPRINT PROOFS.

As you test different designs, print out copies to compare to your source materials, as well as to see which design you, or your client, like best. Any color StyleWriter or color inkjet printer will work — we printed proofs of our balloon on a Kodak XL7700 dye-sublimation printer. We compared

the prints with the actual fabric and were satisfied that our digital colors were representative. You may want to pay a visit to a service bureau if you need high-quality prints to show a client; our "client" was pretty easy to please.

5. GET YOUR DESIGN OFF THE GROUND. The final step is the manufacture of the actual project, using the digital prototype you've created. We sent our illustrations and a "cutting list" — a chart of the balloon panels, complete with color indications for each panel — to the factory for construction. Cameron Balloons built the balloon, and we received it three weeks later. When compared to the Illustrator prototype, this photo of the *Vaporware's* inaugural flight shows just how successful our technique was.

Creating PostScript Files

To create files that print anywhere, anytime, follow these rules of PostScript.

AFTER LAST MONTH'S speculation about which OS we'll be using in the future, we thought we'd come back down to earth with some real-world problems — PostScript files. There are two fundamental questions: "What's the right way to make a PostScript file?" and "I've been given a PostScript file, but how do I know it will work?" We'll address these questions in two parts — in two columns.

Let's make sure we understand the problem. In most cases, service bureaus and prepress houses prefer to output files directly from an application such as Adobe PageMaker or QuarkXPress. Working with native files gives them greater flexibility for correcting errors in setup, typography, and so on. However, sometimes service providers ask you to supply PostScript files instead. Why? The No. 1 reason is compatibility. Any problems that arise if the versions of the operating system, applications, or fonts don't match can be avoided by using a PostScript file. That's because it captures not only the content of the pages but also those idiosyncrasies of the original system.

Usually you create PostScript files by using the Print command and clicking on File instead of choosing the printer as the destination. The printer driver then generates PostScript code and sends it to your hard disk instead of to the printer. In the current version of Apple's LaserWriter printer driver (8.4.1 at press time), you make the selection in the pop-up menu at the upper right of the Print dialog box. After you click on Save, you will be asked to designate where on your hard disk you want the file to be saved (it's a good idea to have a lot of disk space available, because PostScript can be verbose). So far, so good.

But creating a PostScript file that will print flawlessly from someone else's output device also requires that you make the right decisions when preparing the file. Is the final output black-and-white or in color? Does the output device have more than one tray? Although

PostScript is device-independent, some device-dependent attributes must be embedded in the PostScript code.

To do all the above, you have to make sure to choose the correct printer driver (the software that turns WYSIWYG data into PostScript code) for the destination output device. You accomplish this by selecting the final printer's PPD (PostScript Printer Description) file. PPDs reside in the Printer Descriptions folder, in the Preferences folder, in the System Folder. You can usually choose the PPD in the Page Setup dialog box of your page-layout application, but you also need to click on the Setup button in the Chooser to make sure the right one is selected. Make sure, too, that you have the correct version of the PPD your service provider uses.

Driving Deeper

Now, when you print, you can select the other appropriate choices in the Print dialog box. After you choose File as your print destination, click on the pop-up menu immediately below (which should read General) and select Save as File. This will bring up a new set of choices. The next option is Format. If you're creating PostScript for someone else to output, choose PostScript Job from the Format pop-up menu.

The next option lets you select PostScript Level 1 or Level 2 compatibility. Unless your service provider instructs otherwise, always choose Level 1 compatibility. Your provider may have similar output devices of different ages, each of which may have PostScript interpreters. Using Level 1 as your default lets

your provider use Level 1 — as well as Level 2-compatible machines.

Your next choice is data format: ASCII or binary. Binary creates smaller files than ASCII and usually turns out to be the better choice if your service provider uses a Mac to download the PostScript file into the output device. But if the code will be sent from a PC, then choose ASCII.

Finally, you'll reach the Font Inclusion pop-up menu. Of the choices appearing there (None, All, All But Standard 13, All But Fonts in PPD File), the safe choice is All. This option increases the file size and may duplicate fonts already installed in the output device. That's OK. These days, computers, networks, and processors are fast enough to handle the excess overhead, and it's a small price to pay to ensure font compatibility.

In our next column, we'll look at how to tell what has been included in a PostScript file and what to do to verify that it will print properly before you commit to actual output. ☐

NETWORKING

If your file server or
router goes down,
you'll hear about it
from users.
Wouldn't you rather
know first?

By John Rizzo

Keeping an Eye on Your Network

MAC NETWORKS HAVE always been the most plug-and-play around, but that doesn't make them impervious to broken cables, misbehaving routers, or crashing servers. Fortunately, you don't have to wait for users to begin complaining about a network disaster before you take remedial action. Network-monitoring software can warn you of problems as soon as they occur or even spot symptoms before they bring down the network. Combining the right software with some troubleshooting techniques can keep network headaches to a minimum.

Network-monitoring packages generally fall into two categories: those that observe and analyze network traffic and those that monitor the status of specific devices — routers, servers, and so on. Traffic monitors are best suited for discovering networkwide configuration problems, whereas device monitors can locate isolated but critical network failures.

Traffic Reports

Network-traffic-monitoring software is based on the idea that a change in the level or type of traffic on your network often signals a problem. A drop in network traffic, for instance, can mean that a heavily used server has gone

down or that a network segment has been disconnected by a misbehaving router. Similarly, an increase in traffic can signal a technical problem such as a packet storm — a flood of network signals broadcast by a malfunctioning network device.

Other changes in network-traffic patterns have nothing to do with device failures but result from the evolution of the network and its use in your organization. These changes may indicate that you need to reconfigure some portion of the network. Congestion on a segment may warrant the creation of a new one or the movement of a server or an imagesetter to its own segment. A gradual rise in overall *network utilization* — the portion of the total possible network bandwidth being used — can signal a slowdown in network performance you might not notice without a traffic monitor.

To detect a change in network-traffic patterns, you need to know what is normal for your network. Skyline and Satellite, from The AG Group, are good tools for finding the traffic baseline on multisegment networks (networks that have at least one router). Satellite is a data-collection engine that runs on a Mac and takes over its Ethernet port, making it

unavailable for other network tasks, such as printing. To monitor an entire multisegment network, you install a copy of Satellite on one Mac on each segment. Each "satellite" delivers traffic information to Skyline, which runs on a central Mac. Skyline processes the Satellite data and generates graphs representing traffic patterns over time. You can look at this data in slices of time ranging from a minute to several days and can configure Skyline to report certain anomalies.

To create a baseline for your data usage, you might record hourly time slices over the course of several days. Skyline can display the overall network utilization for each segment and can provide statistics by protocol. For instance, you can see how much network bandwidth is being eaten up by Web-browsing and Usenet-reading users by having Skyline count HTTP (Hypertext Transfer Protocol) and NNTP (Network News Transfer Protocol) packets. To see how heavily a printer on a network segment is being used, you can monitor PAP (Printer Access Protocol) traffic on that segment. You can also use Skyline to tell you which Macs, PCs, or other devices use the network the most.

After you've created a traffic baseline, you

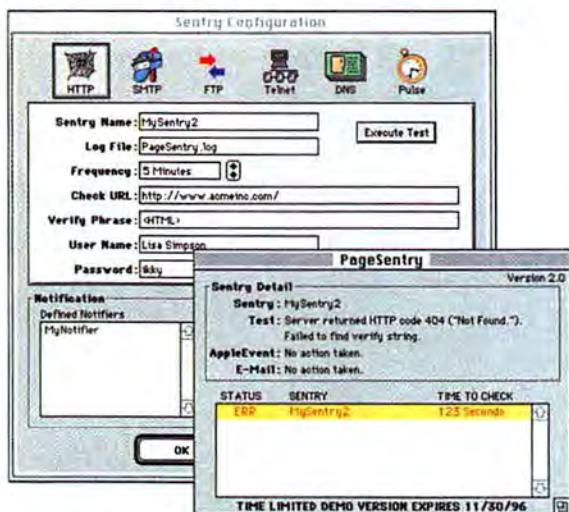

figure 1 / PageSentry periodically tests Web, e-mail, FTP, and other server applications running on an Internet server and can report failures via pager, via e-mail, or to an AppleScript-aware application.

can set Skyline to notify you when traffic moves significantly above or below it. Skyline can notify you via a dialog box, a sound, or an alphanumeric pager message. NetMeter, another AG Group tool that uses Satellite data to monitor the network, can help you track traffic by issuing a variety of meters, charts, and audio and visual alerts. You can monitor total network traffic, or you can limit yourself to particular protocols or a heavily used Web, AppleShare, or NetWare server. You can even monitor your network while you're on the road, by using NetMeter to access a satellite via an ARA connection.

If your network-monitoring needs are simpler — perhaps you have only one network segment — or if your budget can't stand dedicating a Mac to run Satellite, you can use Neon Software's TrafficWatch II for monitoring network utilization. TrafficWatch monitors a

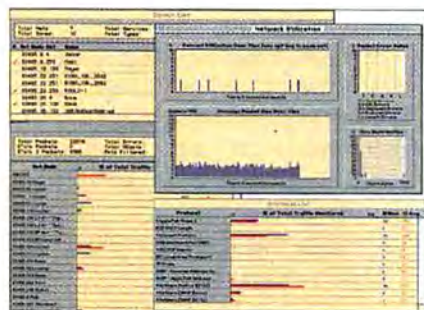

figure 3 / TrafficWatch II can display live network-traffic data by node, by device type, and by protocol, all of which are handy for tracking down bottlenecks and problem areas. It can also display network utilization and average packet size.

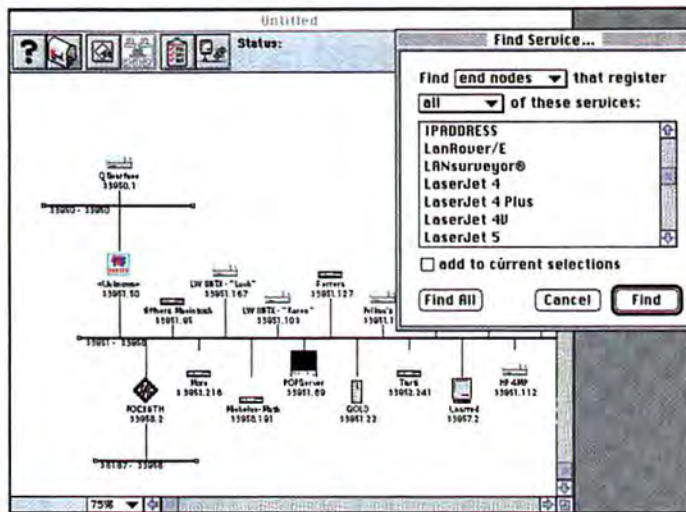

figure 2 / LANsurveyor (shown here) and Net Watchman can each draw a map of your network's servers, printers, routers, workstations, and other nodes. LANsurveyor allows you to concentrate on specific device types by creating maps that include only those devices you're interested in.

single network segment and displays bar charts of network statistics, including network utilization rates, packet sizes, error rates, and percentage of network traffic by protocol type. You can also call up a handy pie chart showing the portion of network traffic attributable to each node — workstation, server, printer, or router. For analyzing trends over time, you can save the data and export it to TrafficChart, a Microsoft Excel macro included with TrafficWatch.

Your Own Devices

When the functioning of a server or a router, rather than overall traffic levels, means life or death for your network, your attention is better focused on the device than on, say, how much network bandwidth the marketing department was using at lunchtime. If the server goes down, nobody gets any work done. You can monitor critical servers, printers, and even routers with tools that watch for failures and let you know when they occur.

Rating Network-Monitoring Products

CyberGauge 1.0

Price: \$139 (list).
Pros: Inexpensive. Lets you save/review utilization data.
Cons: Monitors one IP router only. Can't search for routers.
Company: Neon Software.

LANsurveyor 3.0

Price: \$395 (list).
Pros: Can query a DNS to find an IP address. Sends alarms to pager. Supports SMTP.
Cons: Supports AppleTalk and IP only. Confusing configuration.
Company: Neon Software.

Net Watchman 2.2.3

Price: \$295 (list).
Pros: Runs in background in less than 1 MB of RAM. Alarms can activate AppleScript scripts.
Cons: Interface needs lots of mouse clicks. AppleTalk only.
Company: The AG Group.

NetMeter 1.0

Price: \$395 (list).
Pros: Good use of multimedia to display real-time data and alarms. Monitors single node or entire network. Multiprotocol.
Cons: Requires Satellite.
Company: The AG Group.

PageSentry 2.0

Price: \$149; PageSentry PRO 2.0 (supports 100 servers), \$395 (list).
Pros: Tests a variety of IP services (HTTP, FTP, SMTP, DNS, Telnet). Sends alarms via e-mail or AppleScript.
Cons: No traffic info. Few status indicators within the application itself.
Company: Maxum Development.

RouterCheck 3.0

Price: \$649 (list).
Pros: Diagnoses multirouter problems, reporting per router and per port. AppleScript alarms.
Cons: Not cheap for small networks with one or two routers. AppleTalk only.
Company: Neon Software.

Skyline/Satellite 1.1

Price: \$795; additional copies of Satellite, \$200 to \$300 each, depending on quantity (list).
Pros: Good graphing. Versatile alarms. Good tools for analysis of packet and byte data. Multiprotocol.
Cons: Expensive. Requires dedicated network interface.
Company: The AG Group.

TrafficWatch II

Price: \$495 (list).
Pros: Multiprotocol (AppleTalk, IP, IPX, DECnet). Graphs traffic data by device, protocol, and network utilization.
Cons: Viewing saved data requires export to spreadsheet.
Company: Neon Software.

If your network is divided into segments or if it's connected to the Internet, the router or routers that make this possible are among the most important devices you manage. A failure or misconfiguration may prevent users from printing or may keep your Web server off the Net. Even if the router is working, your network may perform at less than its best if your Internet connection has slowed down. Neon Software's CyberGauge monitors a single IP router and calculates bandwidth utilization,

using the industry-standard SNMP. CyberGauge is easy to use and doesn't require a dedicated Ethernet port, as does Satellite.

You can also monitor AppleTalk routers. Misconfigured routers are the source of a variety of network problems that are difficult to detect with traffic analyzers. For instance, a mysteriously vanishing network segment, known as a black hole, can occur when two or more routers have different AppleTalk-address numbers for the same Ethernet segment. Neon

Software's RouterCheck can find black holes by looking at all the AppleTalk routers on a network, reporting the segment- and zone-configuration information, and recommending corrective action. RouterCheck uses both SNMP and AppleTalk to communicate with a wide variety of AppleTalk routers. It can notify you when a router configuration changes; when router ports stop responding; and when router responsiveness slows down, in the case of an overly taxed router. It notifies you via a dialog box, a sound, or a pager message.

To keep tabs on file and Internet servers, production printers, and other network workhorses, you need a tool that can locate and monitor specific AppleTalk devices. The AG Group's Net Watchman is a simple background application that creates a list of some or all of the AppleTalk nodes on a multisegment network. When a device goes down, Net Watchman notifies you with a page, an e-mail message, a dialog box, sounds, or an entry in a log file. Like CyberGauge, Net Watchman is simple and doesn't require a dedicated Mac. Its use is limited to AppleTalk devices, however. Neon's LANSurveyor can also track wayward devices and draw a map of your network (see figure 2).

If your network contains IP devices, you'll need a different tool to monitor them. PageSentry, from Maxum Development, uses SNMP to communicate with IP-based devices, such as Web servers, letting you know when devices disappear from the network. It can also tell you when a particular service or protocol stops functioning. You can set PageSentry to send an e-mail message or an alphanumeric page and to automatically restart a Mac-based server after a specified downtime.

Advance Notice

There is nothing more unpleasant for a network manager than a network failure. Implementing one or more early-warning systems to alert you to problems you may not have discovered on your own gives you a great advantage over the forces of entropy that sometimes seem to rule the network world. Network monitors can also help you solve problems before they strike. Locating the cause of poor performance and nonfunctioning network segments can be much like looking for the proverbial needle in a haystack. Network-monitoring tools can help you sift the statistics. More often, they act as a magnet that draws the needle out for you. 

John Rizzo is a MacUser contributing editor.

Can't run Windows® 95 on his Mac!

got OrangePC®?

When you must run DOS™, Windows®, Windows95, or WindowsNT, no one replaces your Mac as long as you "got OrangePC." Yes, unlike any other product on the market today, the OrangePC hardware card puts the major PC operating systems on all PCI and all NuBus Macs and PowerMacs.

The Intel®486 (or 5x86) processors power our OrangePC 300 series for NuBus Macs, and the 400 series for PCI based Macs. For power hungry users with PCI systems, the OrangePC 500 series supports Pentium processors up to 200 MHz.

Major features include up to 128 Mb RAM on board, 256K cache, parallel/serial/game ports, accelerated SVGA video (2 Mb), and Sound Blaster™ stereo sound. OrangePC also comes with free network software to connect to PC type Ethernet with full compatibility.

And the OrangePC is affordable, with prices starting at \$599! Get a grip on your Mac! **Get OrangePC!**

Now there's one super web site where you can shop with confidence and ease. With over 40,000 computer products and more than 180 vendors, **NetBuyer** is a direct shopper's paradise. A few smart moves of the mouse and you search and compare products, check specs and prices, get advice from the experts at Ziff-Davis, cash in on weekly specials and order what you want direct from vendors — online or on the phone.

From a world-class system to cables and adapters, you can search for it, find it, compare it and buy it without leaving your desk or testing your patience. It's a fast and powerful tool. Come see today. The service is free!

Go to NetBuyer on the World Wide Web (www.netbuyer.com) to enter the NetBuyer sweepstakes. Sweepstakes are open only to U.S. residents who are at least 18 years of age. A random drawing will occur each week between October 1st and December 24th. The prize for each weekly sweepstakes is a check for \$500. No purchase necessary. Void where prohibited or restricted by law. Sweepstakes are subject to the full official rules posted on the NetBuyer web site.

MULTIPROCESSING
SYSTEMS STARTING AT
\$4,999

Lose Wait Fast

Waiting on your PowerMac costs you money

nPOWER Multiprocessing Systems	PowerPC 604e	Cost
 Genesis LT 400+ Mini Tower; Configured*	Dual 200 MHz	\$4,999
 Genesis MP 720+ Full Tower; Non-configured	Quad 180 MHz	\$8,499
 Genesis MP 800+ Full Tower; Non Configured	Quad 200 MHz	\$9,999
nPOWER Multiprocessing Card		
 nPOWER 360+ For PowerMac 7500, 7600 8500, 9500 and SuperMac S900 & J700	Dual 180 MHz	\$1,499

*Includes 16 MB RAM, 2 gigabyte hard drive, 4 MB graphics card

So, lose the wait fast with the world's fastest multiprocessing solutions for the Mac OS. High-speed workstations and an upgrade from DayStar, the inventor of nPOWER multiprocessing technology - the same technology now used by Apple!

How's it work? Easy. One processor is fast, but four processors are nearly four times faster. So, you can move through your imaging, video and 3-D projects in a fraction of the time. That means a lot more work in a lot less time - that translates into real bottom-line gains. Or, for the budget conscious, dual processing is nearly twice as fast, and costs less than comparable systems. You can choose from the inexpensive nPOWER Card, or Mini Tower.

You'll not only have plenty of speed, you have plenty to run on it. Twenty high-speed multiprocessing software packages are now available including Photoshop, After Effects and Premiere from Adobe, Electric Image, Strata Studio Pro Blitz, Apple QuickTime, Metrowerks CodeWarrior, and Deneba Canvas. Another 20 are in development!

As you can see, you can get money-making speeds from a DayStar upgrade for your existing system, or as one of a variety of DayStar Genesis MP computers. Either way, you'll lose wait fast. So if you make money with your Mac, you will make more with a nPOWER solution from DayStar. After all. We invented it.

To learn more, check out our Web Site at www.daystar.com, or drop us an e-mail at info@daystar.com

Nothing is faster. Nothing pays off quicker.

NET.CETERA / By Jason Snell

The Plug-In Paradox

Plug-ins have made multimedia on the Web a reality, but it's easier to plug than to play.

LIKE EVERYONE ELSE on the Web, I could not wait to get my hands on Netscape Navigator 2.0. Navigator 2 was supposed to revolutionize multimedia on the Web, thanks in large part to plug-ins. But plug-ins have been a mixed blessing. They've allowed Web designers to add much-needed spice to their Web pages — but at a price to users.

Plug-in Pains

Adding multimedia content to a Web page is pretty easy — just insert an `<EMBED>` or `<OBJECT>` tag and point to the relevant file on your Web server — whether it's a Shockwave movie created in Macromedia's Director, a FutureSplash vector-based animation created in FutureWave's FutureSplash Animator, or another kind of multimedia file in any of dozens of plug-in data formats. But if members of your audience don't have the required plug-in — and most of them won't, at least at first — they'll instead be interrupted by a "plug-in not found" error dialog box.

Of course, these users can opt to download the relevant plug-in, quit their browser, install the plug-in, relaunch, and go back to your Web site. But a lot of them may choose to skip your page entirely rather than go to all that trouble.

That's not the only problem. Data in popular formats — MIDI sound files, for example — will probably be supported by several different plug-ins. MIDI choices include LiveUpdate's Crescendo, Yamaha's Midi Plug, and several others. Unfortunately, having a MIDI plug-in doesn't mean that your browser is now compatible with any page that contains embedded MIDI. If a page you visit has been designed to work with a different MIDI plug-

in, you might get no music at all, an error dialog box, or other strange behavior.

Netscape and Microsoft aren't ignoring this problem, but right now their solutions aren't great ones. Netscape keeps signing deals to bundle various plug-ins with Navigator — first up was Apple's QuickTime plug-in, which is included as a part of Navigator 3.0, and Macromedia's Shockwave, the Pointcast Network, and Inso's Word Viewer are on the way. Microsoft has built support for various audio and video formats directly into Internet Explorer, but Explorer's built-in support doesn't apply to pages designed for Netscape

plug-ins. For example, even though Internet Explorer supports QuickTime, it won't play a movie on a page written for Apple's QuickTime plug-in.

Plug-ins also eat up a lot of RAM. For example, Macromedia recommends that you allocate 9 MB of RAM to Netscape Navigator in order to run Shockwave. Web authors should keep in mind that every plug-in they add to their pages escalates RAM requirements and prevents more and more low-RAM users from seeing their site as it was meant to be seen.

In the Pipeline

But don't despair: Microsoft and Netscape are both working to make sure that Web surfers aren't doomed to a life of downloading and installing big plug-ins in order to get access to the coolest Web pages. Microsoft's answer to plug-ins, called ActiveX controls, can be downloaded and installed on the fly. If you come to a Web page that requires a control you don't have, Internet Explorer will download the control and then display the content. Unfortunately, most ActiveX controls exist only for Windows, so if Mac users find a page that uses ActiveX, they may be out of luck. Netscape has promised to fix some plug-in problems in Navigator 4.0, which will be released as part of the Netscape Communicator suite (see "Navigator Is Dead; Long Live Navigator," February '97, page 20). Like Internet Explorer's ActiveX Controls, plug-ins needed for viewing multimedia-rich pages in Navigator 4.0 should download and install automatically and then display the relevant item. Microsoft says that it will eventually implement that method of plug-in support in Internet Explorer.

The Solution

Until Navigator 4 becomes widely available, Web authors should use plug-ins with caution. If you do use plug-ins on your Web pages, settle on one or two and use only those, to minimize potential RAM problems and to avoid frustrating plug-in-poor users. Place obvious links on your site to where Web surfers can download the plug-ins if they don't currently have them. And if you must use plug-ins, consider creating two versions of your site — one with all the multimedia bells and whistles and another without any embedded plug-in files at all. By using this approach, you'll keep your hot multimedia site intact without driving away people who aren't as plug-in-savvy. ☐

MacUser Senior Editor, Online, Jason Snell operates several Web sites, including InterText and TeeVee.

Now there's a Pilot for the rest of us.

Pilot™ is your automatic link to the personal info on your Apple® Macintosh® computer.

Pilot includes its own Personal Information Manager software that lets you edit, import and export info to and from your Macintosh.

Pilot stores thousands of addresses, phone and fax numbers, personal notes — you name it.

Touch here to see the day's agenda. Make recurring meetings appear automatically.

Delete old records from your Pilot, and keep for future reference in an archive file on your Macintosh.

Enter any word and touch "Find" to retrieve a stored item instantly.

It's easy to add memory, upgrade software, or in the future, attach products like modems

Prepare a To-Do list, prioritizing items by due date. Make items disappear as you complete them.

Take notes on the road, then later copy and paste them into programs like Word and Excel on your Macintosh.

Enter data once into your Pilot or Macintosh. Then press the HotSync™ button to keep your Pilot and Macintosh up-to-date.

One touch automatically keeps the data on your Pilot safe and backed up on your Macintosh.

At about 4.5" tall, and 5.5 oz. and at \$299*, the new Pilot organizer fits your shirt pocket — and your budget. Yet it's huge on functionality. But instead of telling you all it

pilot™
The one touch organizer

can do, we think you'd rather try it out yourself. To find out where to get your hands on one, give us a call at 1-800-881-7256. To arrange a demo, visit our web site at <http://www.usr.com/palm>.

*The average U.S. street price for Pilot 1000, complete with all desktop PIM software and organizer software, docking cradle and accessories. Additional Mac Pac required at \$14.95. © 1996 U.S. Robotics, Inc. HANDS on

Your Mac won't fetch your slippers when you tell it to, but it can easily follow other verbal commands.

By Shelly Brisbin

Talking Back to Your Mac

TALKING TO ANY electronic gadget, particularly if it's acting up, isn't all that unusual. Having the machine understand and act on what you say — now, that's a neat trick. Macs have been able to speak and recognize your words for a while, but more-powerful Macs and improved software from Apple have made voice control of your Mac truly useful. Apple's Speech Recognition software has recently been updated (it was in version 1.5 at press time) so that more Mac models can use it and so that it's less taxing on your Mac's speed. It's also easier to use, thanks to commercial and shareware AppleScript script collections.

Speech Recognition is not without gotchas, though, and needs a powerful system and some tinkering to get it to perform a good batch of tricks. In this article, we'll help you make your Mac sit up, roll over, open your applications, and even surf the Web, in response to your voice.

Parts of Speech

Before you can get your Mac to do your spoken bidding, you'll need the right software and the right hardware. The right software depends on the Mac you use. If you have a

PowerPC-based system, get the latest version of Apple's PlainTalk software (which includes Apple's Speech Recognition software) for the best results. It's available from Apple's speech Web site (<http://www.speech.apple.com/>) and from MacUser Software Central (<http://www.zdnet.com/macuser/software>).

For the first time, PowerPC-based Performas can use Speech Recognition too, as long as they have PlainTalk 1.5 or a later version installed. You can also use Speech Recognition with audiovisual (AV) Macs, the only non-Power Macs that support it. For these Macs, you should get PlainTalk 1.3, the latest version that runs on them. Unfortunately, this version doesn't have the important option that minimizes the effect of Speech Recognition on your Mac's speed. No matter which version of PlainTalk you use, you must have System 7.5 or later installed on your Mac also.

PlainTalk contains both Speech Recognition (SR) and Text-to-Speech software. Be sure to install not only SR but also Text-to-Speech — it lets your Mac give spoken feedback to your commands. In addition, if you're the type who tinkers with your System Folder, you should make sure that it contains AppleScript. Speech Recognition uses it to automate many

of the commands you're likely to use.

Besides a powerful Mac, Apple recommends a minimum of 16 MB of RAM. We recommend more. Speed and flexibility are much greater with more memory installed or with a boost from Connectix's RAM Doubler 2.

Last but not least, you need to have a 16-bit, PlainTalk-compatible microphone. Apple's PlainTalk mic, which comes with some Mac models, is a good choice. The mics built into many Apple and third-party audiovisual monitors also work. Unfortunately, that old mic that came with an LC or IIsi won't work. For the best results, position the mic a bit above or below eye level and speak normally.

Make Your Mac a Good Listener

With your software and hardware in place, the next step is to configure the Speech control panel (see figure 1). It's a simple procedure, but the choices you make as you do so will have a significant impact on your Mac's speed and on Speech Recognition's responsiveness.

One way to keep Speech Recognition from slowing down your Mac is to control when it "listens" for commands. To maintain the most speed, have your Mac listen only while you're holding down a specific key (the Esc key, by

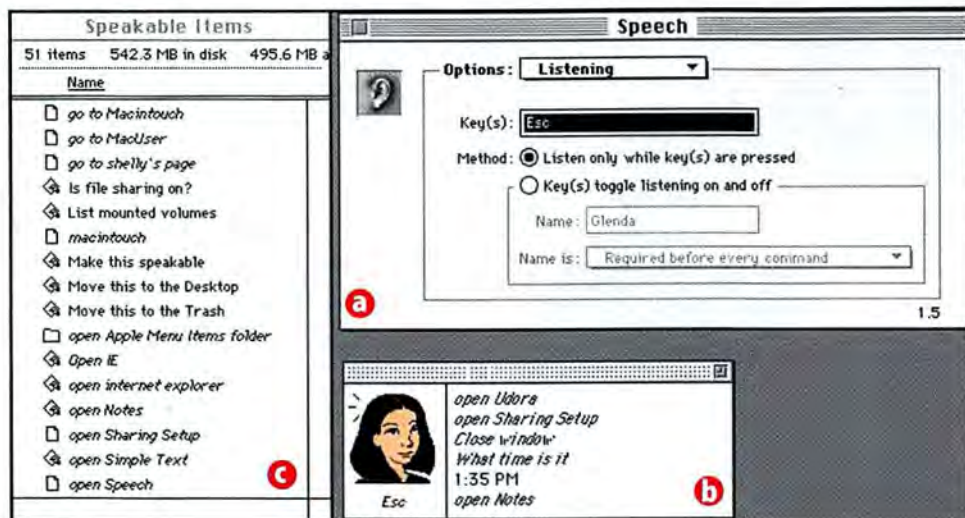

figure 1 / To chat with your Mac, you need to spend time with these three windows. (a) The Speech control panel gives you important options for Speech Recognition. The configuration shown has the least impact on your Mac's speed. (b) Connie, in the lower right window, is one of several characters who stays on your screen at all times, acknowledging commands and giving spoken feedback. (c) The Speakable Items folder shows you exactly what items on your Mac you can control with your voice. You can add to it to have wider control or subtract from it to increase your Mac's speed.

default). To do so, select Listening from the Options pull-down menu in the Speech control panel and select the "Listen only while key(s) are pressed" option.

You can instead have it breathlessly await your commands all the time, but it's more likely to slow down your Mac — just choose the "Key(s) toggle listening on and off" option in the Speech control panel. This option will probably increase the number of misfired commands too — it listens to everything you say and may mistake your casual conversation for an order. To minimize such mistakes and still use this option, you can tell your Mac not to follow commands unless you call out its name first (choose "Required before every command" from the Name Is pull-down menu). Name your Mac whatever you want by typing it into the Name box.

Vocabulary Building

The Speakable Items folder (see figure 1) is the key to pleasant discourse with your Mac. This folder contains the instructions — the aliases and AppleScript scripts — for carrying out your commands. When you issue a command, PlainTalk looks here to find an item with a name that sounds like what you've said. Although more than a couple of dozen items go into this folder automatically when you install Speech Recognition, you'll probably want to add to your Mac's vocabulary. Sure, you'll be able to carry out some useful Finder commands, such as closing an open window, but you won't be able to control applications, using the original set of items.

It's easy to make an application (or any folder or file) speakable: You just click on its icon and say, "Make this speakable." Speech

Recognition does as you ask and even drops an alias of the item into Speakable Items. Tell your Mac to open the item, and — voilà — it opens. Be careful how many items you add to this folder, though. In our testing, we found that the more items you store, the slower Speech Recognition runs.

This brings us to the tricky business of naming files and phonetic pronunciation. If you've ever listened to MacinTalk speech synthesis, you've had a firsthand demonstration of the difference between phonetics and American English spelling. Since Speech Recognition is based on MacinTalk, you'll sometimes have to adjust the spelling of the items in your Speakable Items folder. If you use Eudora to read your e-mail, for example, name its alias "open Udora." If you're not sure how something will sound to your Mac, open SimpleText, type the command you want to use, select the text, and choose Speak Selection from the Sound menu. We used this method to make the screen-sharing application Timbuktu (Timbuktoo) speakable.

Outside Help

Once you've told your Mac to "close all windows" or "start file sharing" a few times, you'll realize that Speech Recognition isn't much good unless you can use it to control more than the Finder and the launching of your applications. You have two choices: dive headfirst into the world of AppleScript, or get some help. If you're an AppleScript scripter already, controlling applications with speech is fairly simple. You can create scripts that invoke menu commands within one or more applications and make the scripts speakable.

If the idea of cooking up your own scripts

from scratch leaves you cold or petrified, there are tools around that can ease the chore or even eliminate the need for scripting altogether. If you use ClarisWorks, Microsoft Excel, Microsoft PowerPoint, Microsoft Word, or Netscape Navigator, consider Scantron Quality Computers' \$49 EZ-Speak (see review, December '96, page 44). It's a collection of over 200 scripts and aliases that control these applications. The speakable items you get with EZ-Speak include menu commands, a few Finder goodies, and over 100 bookmarks for popular Web sites. Since such a large quantity of speakable items is bound to slow your computer to a crawl, get rid of the ones you don't need, such as items for a program you don't use or Web sites you won't visit.

Shareware authors, too, have been dabbling in Speech Recognition. Jonathan Lapin has a collection of scripts called SR 2.0 (http://www.vannevar.com/Mac_SR/index.shtml) that can be modified and used for such tasks as checking your mail and logging onto the Internet via PPP. Lapin's Web site is also a treasure trove of Speech Recognition tips.

A Final Word

If ordering your computer around appeals to you, and if high RAM demands or the prospect of opening up the AppleScript editor hasn't managed to dull your enthusiasm, now's the time to load Speech Recognition. The software is more useful than ever, and hardware is powerful enough to make the technology worthwhile. ☞

MacUser Associate Editor Shelly Brisbin reflexively thanks her Mac when it follows her verbal instructions. It says, "You're welcome," thanks to one of Jonathan Lapin's scripts.

Help Folder

How to tame large herds of fonts, the dual-platform Jaz blues, and Net cookies.

Full o' Fonts

Q. I have an enormous number of fonts. Unfortunately, I have so many of them that they don't all display in my various font pull-down menus. What can I do to organize them?

Joe Olivier
via AOL

CHRIS: I offer the same advice as anyone who's ever passed within a hectare of my crowded office: "Maybe you need to clean this place up." Before ganging your plethora of fonts together into cozy suitcases, it wouldn't be a bad idea to clean out some fonts you may not need. And what do we recommend for just such a cleaning, Bob?

BOB: Why, Font Box, of course. This cool tool from Insider Software sifts through your fonts, checks the reliability of each one, eliminates duplicates, resolves ID conflicts, moves orphaned fonts (Type 1 screen fonts lacking their printer counterparts), and provides several ways to organize your newly cleaned font library. One dose of Font Box should remove a few of those fonts from your menu as well as free up a fair hunk of hard-disk space.

CHRIS: Now that you've tidied up, let's get your font house in order. If you're really serious about organizing your fonts, you'll want a font utility that lets you create application-specific groups of fonts — a group for your page-layout program, another for your graphics applications, and one more for your word processor, for example. Organizing fonts in this fashion guarantees that your font menus will be far less congested. Currently you have

several utilities to choose from: Symantec's Suitcase, ALSoft's MasterJuggler Pro, Adobe's Adobe Type Manager Deluxe, and DiamondSoft's Font Reserve.

BOB: As we write, Adobe Type Manager Deluxe and Font Reserve are in beta, but they should be released by the time you read this. Both look promising.

CHRIS: If you use an extension manager such as Casady & Greene's Conflict Catcher 3 or Now Software's Now Startup Manager, you have a partial solution to font fat within your grasp. These babies let you create not only sets of extensions but font sets as well. Of course, unlike the font-specific utilities we mentioned earlier, these packages make you restart your Mac in order to change font sets.

BOB: And speaking of restarts, you can also give Ed Hopkins' \$10 shareware program Fonts Manager a try. It works like Apple's Extension Manager and allows you to create font sets that can be swapped at startup.

Discordant Jaz

Q. I have both a Mac and a PC, and I'd like to use my recently purchased Jaz drive with both. Is there any way for me to get access to the complete Jaz Tools for both the Mac and PC?

Lane Weiss
Madrid, Spain

CHRIS: I've got a bone to pick with Iomega on this very subject. Let me start by saying that I really like my Jaz drive. It seems solidly built and has a more convenient power supply than that hulking brick attached to my Zip drive. However...

BOB: Here it comes...

CHRIS: ...did it ever occur to the fine folks at Iomega that we are living in a cross-platform world, where people routinely work with Macs as well as PCs?

BOB: Hang on, partner. I know where this is leading. You're whining because the installer erases Jaz Tools for DOS and Windows when

you load Jaz Tools for the Mac.

CHRIS: Exactly! The same thing happens with the Zip drive. Run Zip Install, and the darned thing vaporizes the tools for the other platform. I paid for the cartridge. Shouldn't I be the one to decide what gets erased and what doesn't?

BOB: OK, I agree. Iomega should give you the

Tips / Online

Flashier FlashSession

Tired of sitting around while America Online dials, logs on, logs off, redials, logs on, logs off, and so on because you're checking on an account that has multiple screen names? If you have a dial-up Internet account and AOL 2.5 or later, you can cut out one of the steps in the process.

With the AOL application open but not connected, use the pull-down Location menu to select TCP Connection. Now fire up your PPP/SLIP Internet account, select Activate FlashSession. Now from the Mail menu, check the screen names you would like to use, and click on the Go Ahead button. Because you're logging in via your Internet provider, you don't need to redial with each connection. AOL will simply log in and out for each screen name in succession.

One additional speed benefit you may gain from this procedure is a faster connection to AOL. AOL may not offer a local 28.8-kbps connection, whereas your Internet provider probably does.

Haseeb Omar

WRITE TO HELP FOLDER/TIPS

c/o MacUser
50 Beale Street, 12th Floor
San Francisco, CA 94105

Don't want to wait for an answer? Post your question on the MacUser Forum on either America Online or CompuServe, or send e-mail to helpfolder@macuser.com or tips@macuser.com. We pay \$25 to \$100 for any undocumented tips we publish.

option. But you're not completely hosed — at least not if you have an online account. Just go to the Iomega forum on AOL or to Iomega's Internet site (<http://www.iomega.com/>) and download Jaz Tools for the particular flavor of computer you own.

CHRIS: Hang on a sec. I'm going there now to check this out.

BOB: While Chris is online, let me mention that my just acquired Jaz drive, which has never been sullied by evil-empire operating systems, is thus far functioning flawlessly. I can't imagine why Chris would want to use his with a PC anyway, much less own a PC . . .

CHRIS: I heard that. OK, since print is a not a time-based medium, I've already downloaded the over-5-MB Iomega Tools software, installed it on my PC, and made a discovery or two.

1. Downloading 5+ MB takes a long time. I still contend that having the choice of keeping or trashing the other platform's tools would be a nice gesture to us cross-platform types.

2. In order to use Jaz Tools for the PC, you have to first fire up the Guest program on the PC. This is a fairly painless procedure — just insert the Jaz Windows/DOS installation floppy, run the appropriate Guest program (Windows 95, Windows 3.1, or DOS), and watch as the Jaz drive becomes a fully functioning member of your PC's hard-drive family. Once the Jaz drive has checked in, you can access Jaz Tools.

3. According to the documentation, you have to run Guest only once in Windows 95 — the driver remains on your startup drive, and you needn't bother with the Guest program again. Apparently Windows 3.1 and DOS users aren't as blessed — they have to use Guest every time they want to mount their Jaz drive. To

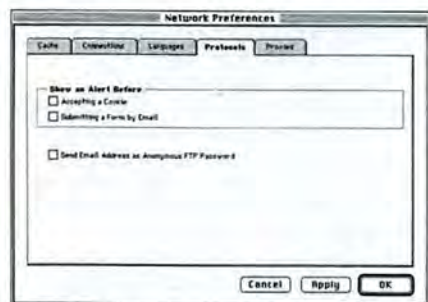

figure 1 / If you see a cookie warning while you're visiting a Web site, that means the maker of the site is gathering info about your online habits. If you'd rather not be reminded of this, you can turn off the warnings by unchecking the top box in this Navigator window.

Tips / Browsers

A Page Too Long

Wouldn't it be nice if you could preview the page breaks in your Web browser so that you knew whether a document you were about to print was just one or two lines too long for a single page? Current browsers don't provide such a preview, but there's a workaround if you use desktop printing.

Before printing, select the printer icon on the desktop and choose Stop Print Queue from the Printing menu. Now print the Web page and wait for the Printer Queue window to appear. If you see that more than one page is being spooled to the

obtain a permanent driver, these users have to shell out \$149 for another Jaz Tools disk.

Are Net Cookies Crummy?

Q. What is this cookie thing on the Web? Whenever I go to the Adobe site (<http://www.adobe.com/>), there's a dialog box that appears indicating that Adobe wishes to set a "cookie."

Martin Lazatin
via the Internet

CHRIS: Martin, if you poke around in your Netscape *f* folder (it's inside the System Folder's Preferences folder), you'll find a file called MagicCookie. If you use Internet Explorer 2.0, the file is called cookie.txt (follow the path System Folder: Preferences: Explorer: Cache). These files contain data that's been sent from an Internet site's server. Numerous Internet sites — including Adobe's — like to save bits of data to a cookie file in order to keep track of how you use the site.

Such data can include the current date and time, a list of links you've clicked on when visiting a particular site, and customization options.

BOB: If you want to get rid of these warnings and you don't mind collecting cookies, go to Navigator's Network Preferences dialog box (under the Options menu), click on the Protocols tab, and uncheck the appropriate box (see figure 1). You'll be free of that dialog box forever. (You don't get the dialog box if you're using Explorer.)

CHRIS: As Bob hints, the real question is whether you mind companies collecting information about your online habits.

Now hang on. Before you sign your paycheck over to the local talk-radio loony, stock your pickup with nonradiated canned foods, and move to a county where the moose population is twice that of bipeds, dig this: Cookies aren't the tyrannical tools of Big Brother.

printer, open Page Setup and scale the size of the printout — say to 90 percent. Now again choose Print. If the printer queue continues to indicate that more than one page is being spooled, reduce the size of the page further.

Because you've stopped the queue, no pages are actually printed. Once you've found the proper scaling percentage, open the desktop printer, delete those files that have more than one page, and select Start Print Queue from the Printing menu. Your Web page will print to one piece of paper.

Stuart Cheshire
via the Internet

To begin with, cookies can be retrieved only by the sites that issued them. So, for example, the congregation at The Shrine of the Most Holy Hanky will have a record of which of its links you've accessed but will never suspect that you've recently browsed Beelzebub's House of Hoochie-Coochie.

BOB: Wow! You have the URL for that one?

CHRIS: Down, boy.

Also, cookies can't be used to unlock the personal secrets contained on your hard disk. No one will discover — at least not through a cookie — that you like to surf the Web while dressed as a marmot.

BOB: True enough. But I'm not willing to help a Webmaster create more-effective advertising. If you're like me and you want to keep your cookie jar covered, try this technique, contributed by reader Mark A. Nicolai via the Internet. Drag the cookie file out of the folder in which it resides (Netscape *f* folder for Navigator users, Cache folder for Explorer), and replace it with a folder with the same name. If you use Navigator, you'll name the folder MagicCookie, for instance. The browser won't be able to create a new cookie file, since files can't replace folders, nor is it possible to write information to a folder.

CHRIS: Scott Barnham's freeware program Cookie Cutter is a bit more flexible. It lets you selectively allow cookies for some sites and deny them for others.

The Last Word on Gold Plating

BOB: David Lerner, a highly respected Mac technician at Tekserve, in New York City, says this of our advice on whether or not to use gold-plated DIMMs (Help Folder, September '96, page 101):

"The rule is simple: [Get] SIMMs tin-plated to match the SIMM sockets, [get] DIMMs gold-plated to match the DIMM sockets . . . eventually you might get fretting corrosion

SHOULD MINICAD 6 BE YOUR CAD SOLUTION?

- ◆ A program tailored to your needs. Specialized tools for many design industries: A/E/C, mechanical engineering, landscape, space planning, food service, theater/lighting and more.
- ◆ A proven market leader that handles any job: 2D, 3D, materials lists and cost estimates.
- ◆ A program that can be used for every stage of the design process — from concept sketches to working drawings and 3D client presentations.
- ◆ A program that's easy to use, easy to buy: lower entry and training costs and less downtime equal higher productivity.
- ◆ THE cross-platform solution: move files flawlessly between Mac and Windows. Full 32-bit power!
- ◆ A program you can try ... RISK FREE!

MiniCad 6

MACINTOSH WINDOWS

THE FULL-FEATURED CAD PROGRAM
with INTEGRATED PROFESSIONAL SOLUTIONS

MINICAD 6: THE COMPLETE CAD PACKAGE!

Just what you're looking for: a hybrid 2D/3D drafting environment; a powerful database to track costs and materials; a built-in macro language to automate routine drafting tasks; full file-transfer capabilities to other major programs, including QuickDraw™ 3D; even digital terrain modeling! All highly organized and easy to use. You even get high-end presentation features and QuickTime™ animation.

FREE DESIGN AND DRAFTING TOOLKIT™

No extra symbol libraries to buy! MiniCad 6 is packed with thousands of symbols, tools, commands, templates, parametrics, formatted reports, worksheets and sample files created for specific industries. These specialized modules are powerful, complete and already in MiniCad 6, giving you both design flexibility and targeted industry solutions.

INTERNATIONALLY RECOGNIZED

Now in its 11th year, MiniCad is the best-selling CAD program on the Mac. And now there's a Windows™ version! Available in 13 languages, MiniCad 6 is used by design professionals in more than 80 countries.

TRY IT RISK FREE FOR 30 DAYS!

When you buy MiniCad 6 from a participating dealer, you'll get our no-hassle, 30-day money-back guarantee. You'll also get 18 months of free technical support, a 24-page newsletter and a CD-ROM with QuickTime demonstrations of each Tool and Command as well as samples of MiniCad files from around the world.

when mixing dissimilar metals."

Mike Frost, president of RAM maker Technology Works, concurs: "Match the metals. SIMM sockets are tin; DIMM sockets are gold. It might not matter for years, but why take the chance?"

CHRIS: Who am I to argue with these experts? Well, OK, I'll argue this much: My buddy who's designed and constructed more circuit boards and handled more computer chips than just about any sentient being on earth had this to say: "If I were sending a probe to Jupiter, I'd make sure that all metals matched. Otherwise, I wouldn't be too concerned about it. In most climates, failure due to corrosion is rare."

SimpleText, Be Gone

Q. In the accolade you gave Tom Bender's Text-Edit Plus (Help Folder, November '96, page 144), you advised us to get rid of SimpleText and use Text-Edit Plus instead. But how exactly is this done? My system still asks for the missing SimpleText when I double-click on a ReadMe file.

J.S. Penner
via the Internet

BOB: I hate it when this happens. We should have explained what to do after eliminating all traces of SimpleText and its even crummier predecessor, TeachText.

CHRIS: Start by opening the Macintosh Easy Open control panel. Uncheck the "Always show dialog box" and "Include applications on servers" check boxes, and check the "Auto pick if only 1 choice" check box. Now, click on Delete Preferences. A dialog box will warn you that you're about to delete any Easy Open links you've got lying around (at least that's what the words in the cryptic dialog box mean). Click on Delete, and then close Macintosh Easy Open.

Next, create a startup set in Extensions Manager, with only Macintosh Easy Open active. Restart, and then rebuild the desktop (hold down Command and Option during startup). Restart again, with your normal complement of extensions active, and double-click on a SimpleText document. This will bring up a dialog box (assuming you've gotten rid of all your copies of SimpleText and TeachText on all mounted volumes) that lets you choose Text-Edit Plus as the substitute application. That done, all SimpleText and TeachText files should open in Text-Edit Plus.

Lock Mess Monster

Q. I read your advice in the November '96 Help Folder about disabling the Help key (page 139), but I've been unable to apply the same techniques to the Caps Lock key. Do you have any suggestions?

Lee A. Licata
Ankara, Turkey

CHRIS: Oh boy, oh boy, oh boy...

BOB: Uh-oh. I can see Chris is gearing up for something big. He's put on the orange overalls and the miner's helmet, which can mean only one thing...

CHRIS: ResEdit!!!!

BOB: Before Chris plunges into the codey depths, I should offer two far-easier-than-ResEdit solutions: Physically remove the Caps Lock key with a key-cap puller, or download a copy of David Sumner's OptionCaps. It's an extension that forces you to press Option-Caps Lock if you want the Caps Lock key to do its stuff — making it impossible to accidentally engage Caps Lock.

CHRIS: My turn? My turn? Lee, the reason you can't use a macro program to disable Caps Lock is because it's different from most of the other keys on your keyboard. Like the Shift

and Control keys, it alone can't generate a character. Although the Help key doesn't appear to generate a character either, it is capable of it. Go ahead, open Key Caps and see for yourself. Push Help, and the cursor moves forward. Push Caps Lock and — nada.

Therefore, in order to keep Caps Lock from generating capital letters, you must change the characters produced when Caps Lock is pressed. And this means using Apple's ResEdit. Here's what you do:

(1) Open your System file (in your System Folder), locate the U.S. - System 6 file, and Option-drag it to the desktop. This will create a copy of the file. (2) Open the copy with ResEdit. (3) Open the KCHR resource. (4) Select the one resource (it's ID 16383), and open it with a double-click. (5) Press the Caps Lock key. You'll notice that the on-screen picture of the Caps Lock key darkens. (6) Drag the lowercase letters in the upper window to the appropriate spots on the picture of the keyboard; drag *a* to the A key, for example. Change only the letters; leave the numbers alone. (7) Use the Save As command to give your hacked file a unique name — something like No Caps Lock will do nicely. (8) Drag your No Caps Lock file to the closed System Folder. You'll be asked whether you want the file placed in the System file. Indicate that it's okeydokey with you. (9) Restart your Mac. (10) To get rid of Caps Lock, open the Keyboard control panel and select the No Caps Lock layout you just created. From this day forward, pressing the Caps Lock key will seemingly have no effect when you type.

BOB: Gee, that was swell. Why would you want to go through all this trouble when you could use OptionCaps instead?

CHRIS: For the most important reason on earth: In such first-person-perspective shoot-'em-ups as Marathon, Quake, and DOOM, I configure the Caps Lock key as the "always run" key. Using OptionCaps would force me to hit the Option key first, wasting valuable milliseconds and increasing the risk that I'll be fragged in a heated network battle. ☹

Tips / System Tricks

HotSauce on Your Hard Disk

I've been playing around with Apple's HotSauce, formerly called Project X — the application that allows you to navigate the Internet in 3-D. I discovered that you can also browse your hard disk in this fashion.

Just drop your hard disk's icon onto the HotSauce stand-alone application's X-space Window, and HotSauce will catalog your disk and display your files (as shown here) — even the invisible ones. You can then use the X-space window as a 3-D Finder for launching applications and opening files. If you prefer a 2-D list view, click on your hard disk's name and press Command-S for Finder view.

Bill Stephenson
via AOL

[You can download HotSauce from <http://hotsauce.apple.com/>. — Ed.]

Bob LeVitus is the author of 20 computer books and is a columnist for the Houston Chronicle. Christopher Breen recently coauthored The Macintosh Bible Guide to Games, published by Peachpit Press.

Seeing Double

Using more than one monitor with your Macintosh system gives you room to roam, and it's a lot easier than you may think.

IF PROLIFERATING applications and windows are overtaking your Mac's screen, you may think replacing your monitor with a bigger one is the natural solution. But before you bulldoze your current screen real estate to make way for an expensive new high-rise monitor, consider an alternative: adding onto your property.

Since the days of the Mac SE, the OS has supported multiple monitors whose desktops can be arranged in perfect alignment to each other. Adding more monitors offers a cost-effective way to increase your display area without tossing your existing investment.

Although 21-inch monitors often top \$2,000 each, good 14- and 17-inch monitors can be found for \$500 to \$1,000 each. Smaller displays are typically sharper, and since windows displayed on them tend to be smaller, scrolling and screen updating are faster. The easy availability of small monitors and the lure of a larger Mac desktop have led some Mac-User editors to top their Mac systems off with as many as three monitors. But why stop there? We've had as many as six running with one Mac in our lab. Here are some tools and tips to make a dual-monitor setup work. You can use the same techniques to add even more.

Get a Graphics Card

Besides finding a good-quality monitor to be a second display, you'll need a graphics card to run it. The first thing to consider is the maximum bit depth and resolution you'd like your new monitor to display. If you need only 832 x 624 pixels of 24-bit color, a 2-MB graphics card will suffice. For a crisp 1,152 x 870 at 24 bits, you'll need a 4-MB card. For even higher resolutions, consider getting an 8-MB card. If you don't need 24-bit color, you can get a 2-MB card that can support 1,152 x 870 pixels at 8-bit color — it's a bargain at as little as \$200.

If your current monitor is already connected to a graphics card (rather than the

Mac's built-in video port), we recommend that you buy the card for your new monitor from the same graphics-card vendor, for compatibility and top performance. Whether you buy a new graphics card or use an existing one, the way you pair cards and monitors can significantly affect the screen view you'll have. If you're doing DTP or other graphics-intensive work, pair the larger monitor with the better graphics card and leave your e-mail, word-processing, or other text-heavy work for the low-resolution monitor.

The second factor to consider when pairing cards with monitors is speed. You should arrange your monitors so that the one you use most is running on the fastest graphics circuitry. We recommend running MacBench 4.0's Graphics test on each display system (the combination of graphics circuitry and monitor) to see how they compare. If you're a desktop publisher, you should run the Publishing

Graphics tests too. Note that MacBench results can be compared fairly only when both display systems are set to the same resolution and bit depth.

Avoid Interference

If you plan to use both monitors at the same screen resolution and refresh rate — 1,152 x 870 pixels at 75 Hz, for example — you can place the two monitors right next to each other. If, however, you plan to run them at differing resolutions or refresh rates, you may need to separate them by 6 to 12 inches, to avoid interference. Magnetic interference manifests itself as a visible shaking of the displayed images where the monitors are closest to each other. TCO-compliant monitors — which tend to be a bit more expensive — have fewer magnetic emissions than other monitors and can be placed closer to each other than non-TCO-compliant models.

A Triple Threat / three heads are better than one

USING THREE RELATIVELY INEXPENSIVE MONITORS lying around the MacUser offices and two graphics cards, one editor created a megasystem that displays over 2 million pixels. This setup lets him view the office calendar, surf the Web, analyze test data, and edit his current projects at the same time.

Choose Your Resolution

The first time you start up your computer with a new graphics card and monitor, the Mac OS gets information from the graphics card, which in turn checks the monitor cable or cable adapter for special circuitry called *sense codes*. These codes tell the card which resolutions and frequencies the monitor supports. After this process has been completed, the card defaults to a resolution and refresh rate that are compatible.

But the chosen configuration often doesn't provide the resolution you want. You can make changes to the default resolution via the Monitors control panel: Select a monitor icon in the control panel. Click on the Identify button to find out which icon corresponds to which monitor. Once you've selected a monitor's icon, click on the Options button, and you'll get a list of options for that monitor. After you've selected a resolution for each monitor in this way, you can set the number of colors (the bit depth) from the list of choices available in the main window of the Monitors control panel.

Align Your Displays

You may notice that your Mac has your monitors reversed: It thinks your second monitor is on the left, even though you've actually placed it on the right. That's because the Mac

orders monitors according to which slots their graphics cards occupy inside your Mac. Fortunately, this is easy to fix. Open the Monitors control panel, and drag the icon of the monitor you want to move to the other side of the window. Note that there is only one limitation on the placement of these monitor icons — they must be touching each other so they form a continuous desktop and the mouse has a way to get from screen to screen.

If you have an AV Mac, the Monitors control panel will display an extra icon: a "ghost" monitor icon that's associated with the AV Mac's built-in video-out circuitry. Unless you have an NTSC monitor or television set connected to this circuitry, you'll want to get the virtual display system out of the way, to minimize the chances of losing your mouse pointer. The best way to banish the ghost is to align this icon with the lower-left corner of your leftmost monitor (see figure 1). That way, if you lose your mouse's pointer, you can find it by dragging up and to the right.

On one of the monitor icons, you'll see a visual representation of a menu bar. You can drag the bar to any monitor icon to make that monitor your primary monitor (it will display the menu bar after you restart). If you hold down the Option key while clicking on a monitor's icon, you'll see a small Mac icon with a smiley face, indicating which monitor will

display the "Welcome to Macintosh" message and startup icons. This icon too can be moved.

Once your monitors are in proper order, it's time to start perfecting their alignment. To accomplish this, open a window (Stickies works just fine) and expand it so that it appears across both monitors — this will give you a visual cue as to how well the displays are aligned. If the window on the left-hand monitor is lower than it is on the right monitor, go to the Monitors control panel and move the left monitor's icon up just slightly. Reboot your Mac, and repeat this process until you get it just right.

Safeguard Your Setup

The alignment of your displays is now perfect, but that alignment will be ruined if you change the resolution of either monitor. You can bulletproof your Mac in order to make it difficult for you or anyone else to change resolutions. One way is to hide the Monitors control panel somewhere else on your hard disk. Even if this file isn't in the Control Panels folder, it's still usable — just hidden from easy access. Second, if you use the Mac Control Strip, you'll want to remove the Monitor Resolution module from the Control Strip Modules folder (within the System Folder). This will prevent anyone from changing the resolution of your monitors via the Control Strip.

Remember, it's only your displays' resolutions that are critical to their screen alignment. You can still change the bit depth on each without mucking up their alignment to each other. Since you've hidden your Monitors control panel, the easiest way to do this is via the Monitor Bit-Depth module in the Control Strip. Keeping the Control Strip and this module active is a smart idea — that way, you can switch your monitor to black-and-white, for superfast scrolling in Word or Excel, when it's needed.

And while we're on the subject of scrolling, you should remember that the Mac OS needs to communicate with each graphics card every time the contents of a screen change. So be careful not to allow windows to overlap onto two screens unless it's absolutely necessary; otherwise, your scrolling speed will slow to a crawl. 

Jeff Pittelkau is director of MacUser Labs.

figure 1 / You can move monitor images around in the Monitors control panel, to create just the right alignment. You can also get the "ghost" icon created by an AV Mac's video circuitry out of the way. Here, three monitors are attached to an AV Mac. The fourth icon is the ghost.

 The latest version of the MacBench benchmark software is available online on ZD Net from Ziff-Davis Benchmark Operation at <http://www.zdnet.com/zdbop/>.

DIRECT LINE

For many of you, mail order is your primary means of purchasing Macintosh products and services. That's why MacUser has put together the following special section.

It's what you've been demanding—a convenient place to quickly find the products you need from the vendors you want to buy from.

MacUser

MacUser's Direct Line to products is just one more reason to turn to MacUser for the relevant information aimed at the serious user.

POWER COMPUTING

Presenting the PowerBase 180

This revolutionary Mac OS compatible features one of the fastest Mac CPU speeds. But that isn't the only thing the PowerBase has going for it. You can easily upgrade to faster future processors with a simple daughtercard swap. Each PowerBase is packed with a super-speed 8X CD-ROM drive for fast access to hundreds of multimedia titles. And it's available in low profile (to save space) or tower model (for extra expandability).

Only ProDirect Has Speed-Tuned Hard Drives

At ProDirect we take the time to speed-tune each hard drive to exact manufacturers optimum operating specifications for the Macintosh, and put it through a rigorous test-run inspection routine to insure that it is dialed-in to its peak level of performance.

SPEED-TUNED HARD DRIVES

FAST SCSI 2

Fast SCSI 2 allows for transfer rates of up to 10 Megabytes Per Second.

SIZE	DRIVE	SEEK TIME	INTERFACE	INTERNAL	POWERSTOR
240MB	Quantum LPS	10ms	Fast SCSI 2	110	170
540MB	Quantum Fireball	9ms	Fast SCSI 2	155	215

* When utilized with an appropriate SCSI Accelerator Card

The wider 68 pin bandwidth inherent in a Fast & Wide drive is utilized by a Fast & Wide SCSI accelerator card. Note: All ProDirect Fast & Wide hard drives come with a free 68-pin adapter that allows use of the Fast & Wide drive on your current Mac. Later, the adapter can be removed and replaced with a Fast & Wide accelerator card that will render the increased transfer rates.

Transfer Rates Qualifier All drives were tested utilizing a UMAX 150 MHz CPU with 32 Megabytes RAM. Adapter 2940 Ultra SCSI Accelerator and MacBench software. Sustained transfer rates will vary depending on system type, memory, PCI cards and software. All drives were formatted and configured with FWW Toolkit and Speed-Tune according to Manufacturer documented guidelines.

Blinding Speed! Ultra AV 8.7GB

Fast & Wide Ultra SCSI 3 Only **1645** Int.

□ Sequential Transfer Rate of 11.5 MB/Sec. with **1745** Ext.

Adaptec 2940UWM □ 5ms Seek □ 7200 RPM (PowerStor)

□ 512K Cache Buffer □ 5 Year Warranty (4 Hour Replacement)

ALL PRICES ARE SUBJECT TO CHANGE WITHOUT NOTICE. RETURNED ORDERS ARE SUBJECT TO A RESTOCKING FEE. INTERNATIONAL CUSTOMERS PAY ALL SHIPPING CHARGES. ALL SHIPPING CHARGES ARE NON-REFUNDABLE. TO RETURN REFUNDABLE CALL FOR AN RMA NUMBER. ALL RMA'S MUST BE RETURNED WITHIN 15 BUSINESS DAYS OF ISSUANCE. CUSTOMERS ARE RESPONSIBLE FOR SHIPPING CHARGES TO RETURN PRODUCT.

FOCUS enhancements Lapis Color MV Cards

\$249

from Compare at \$399

- Multiple resolutions up to 21"
- 10BASE-T ethernet
- Uses PDS slot leaving your PCMCIA slot available for other uses.

The Lapis Color MV card is the only solution that does not use your PCMCIA slot, thus allowing for additional uses such as a modem for your PB5300. Since the card was jointly developed with Apple, it is virtually the only ethernet solution that does not drop data packets and is the only external video solution available.

For prices starting from \$249, you will not find a better value!

APS TECHNOLOGIES: HIGH-TECH 2 GIG FOR ONLY

New Lower Price!

Give your Mac the extra storage space it needs by installing the new APS Q 2100. At only 17¢ per MB internal, the APS Q 2100 is the value leader in 2GB SCSI hard disk drives. Its performance is a great match with any application, and it is backed by a 3-year warranty.

JUST THE RIGHT CAPACITY!

APS Q 3200

- ✓ 3GB for the price of 2GB
- ✓ Works on SCSI-2 and Ultra SCSI buses
- ✓ 4500 rpm mechanism

2GB is too little, 4GB is too much. The new APS Q 3200 is priced lower than some 2GB SCSI drives, yet it delivers a perfect 3000MB of reliable storage. This drive uses MR heads and an advanced PRML read channel to fit its 3GB into a 3.5" low profile Ultra SCSI drive.

1.2GB OF STORAGE FOR ONLY

APS Q 1280

- ✓ High areal density and PRML read channel
- ✓ Works on SCSI-2 and Ultra SCSI buses

Finally there's a hard drive that combines the reliability of a 4500 rpm mech. with high performance. The APS Q 1280 uses MR heads, PRML and Ultra SCSI technology for improved performance. It is backed by a 3-year warranty.

\$329⁹⁵

Internal configuration
Quantum

APS Q 2100

- ✓ MR heads, PRML and Ultra SCSI Technology
- ✓ Reliable 4500 rpm mechanism
- ✓ Works on SCSI-2 and Ultra SCSI buses

APS is now bundling Nisus[®] Writer 4.1 at no extra charge with all of its formatted hard drives and M•POWER systems.

APS M-POWER 603e160[™]

1GB REMOVABLE! APS Jaz

- ✓ Hard drive performance
- ✓ Huge 1GB capacity on removable media

APS Jaz drive with 1 cartridge \$499.95

Includes THREE cartridges

The immense 1GB capacity of its removable media has changed the removable storage market forever! The APS Jaz's performance rivals most fixed-platter hard disk drives; and who would you rather buy it from than APS?

APS 230 MO

- ✓ Up to 217MB of reliable optical storage
- ✓ 256KB cache buffer
- ✓ Choice of enclosure

APS 230 MO in SR 2000 enclosure \$379.95

BEST VALUE IN MO!

\$299.95

External configuration
SR 1000 enclosure as pictured

Our best value ever in removable media devices, the new APS 230 MO is the perfect solution for your growing data storage needs. It's compatible with 230MB and 128MB MO cartridges and delivers excellent MO performance.

STEAL THIS 12X CD-ROM DRIVE! APS CD12

- ✓ High performance 12X CD-ROM drive
- ✓ Great for home and office CD-ROM use

\$179.95

External configuration
Slimline case*

Smooth full-screen video output, the 12X performance of the APS CD12 supercharges any CD-ROM application! Its speed enhances multimedia AND business CDs. At this incredibly low price, you can hardly afford to live with that old 2X or 4X CD ROM drive.

*Does not include G-Team™

Introducing ICE, the industry's hottest (and coolest) enclosure cooling technology.

A radical new concept in drive mechanism climate control, APS' exclusive ICE system uses digital technology to sense heat build-up around the drive mechanism. Applying that information, ICE controls a high-performance, super-efficient ball bearing fan subsystem to maintain mechanism temperature comfortably within the manufacturer's specified operating range. Should the mechanism exceed the specified operating temperature range, the intelligent ICE circuitry provides a clear indication that a thermal problem exists. This approach drastically reduces cooling noise at low ambient temperatures, and improves both fan and drive mechanism life.

"Best Mail-Order Company!"

PC Connection was awarded "Best All Around Company" for the second year in a row by The Boston Computer Society!

The highly regarded Berkeley Mac Users Group (BMUG) named MacConnection the Best Mac Mail-Order Company.

OUR POLICY • VISA, MASTERCARD, AMERICAN EXPRESS, and NOVUS cards. No surcharge. • Most products are covered by manufacturer's warranty against defects for at least 30 days from the invoice date. • All returns require prior authorization; please call for an RMA. • We are not responsible for typographical errors. • Pricing and promotional items are subject to change without notice. • Continental U.S.: Shipping Charges: \$5 per order up to 10 pounds. On orders weighing 10 pounds or more, shipping is \$1 per pound. Please call for weight/shipping charge information. Items of excessive size and/or weight may require additional days to deliver via a freight carrier. Please check with

your sales rep for more details. Barring events beyond our control, all credit card orders placed in weekdays by 3 a.m. ET will ship Airborne Express for delivery the next business day. Saturday delivery available to many areas upon request at no additional charge. Order all day Saturday thru noon Sunday for Monday delivery. Some areas require an extra day delivery. APO/FPO, International orders and Hawaii, Alaska, Canada, Puerto Rico & U.S. Virgin Islands: Shipping may require additional time and charges. All other areas: Call 800-446-4444 or FAX: 603-446-7781 M-F 9 a.m.-5:30 p.m. ET.

\$0 Down 100% Business Financing NO Payments for 90days

FREE!
5 x 200 mb
Syquest Cartridges
with Ultimate lease
\$345 Value

Why Lease?

- \$0 Down 100% Business Financing No Payments for 90 days. You can lease hardware, software and extended warranties.
- Converts a large cash purchase into low monthly payments.
- Leasing allows your business to pay for equipment as it generates income, not before.
- Computer equipment depreciates rapidly, so don't spend your hard earned capital, it's the most important asset your company has.

Why Lease or Buy from Digital Graphix?

WE PROVIDE THE BEST VALUE ADDED SERVICE IN THE INDUSTRY:

- We are system experts. WE ARE NOT ORDER TAKERS. We offer the best service, price and selection.
- We cater to marketing and advertising professionals, printing shops, service bureaus, multimedia, digital imaging, and CAD/CAM professionals. Our Business is knowing your mac system needs.

COMPUTER DISCOUNT WAREHOUSE[™]

Software for WORK—or PLAY!

COMPUTER DISCOUNT WAREHOUSE™

Adobe Illustrator V6.0

Feel the ultimate power of Adobe Illustrator™ V6.0!

Adobe Illustrator™ V6.0 software for Macintosh® and Power Macintosh combines the finest illustration tools, image-handling capabilities and typographic features to give you the ultimate power to create. Now you can import TIFF images, use Adobe Photoshop® compatible plug-in filters and even rasterize artwork, all within Adobe Illustrator. And, because all Adobe™ programs work together seamlessly, it's easy to get the results you want.

3.5 + CD* **\$359.18** CDW 72995

Adobe Illustrator 6.0

*The full version of Adobe Illustrator V6.0 (CDW 72995) includes a free copy of Adobe PageMill V2.0. Offer good while supplies last.

CLARIS FileMaker Pro V3.0

Move up to FileMaker Pro 3.0 and make your solutions easier

From the moment you open the box, FileMaker Pro V3.0 makes your life easier with relational capabilities, more than 40 predesigned templates, powerful task-automation features, word processing enhancements and hassle-free integration of your old FileMaker files.

Version upgrade..... **\$89.75** CDW 63951

Full version **\$176.25** CDW 63817

FileMaker Pro V3.0 Server **\$899.29** CDW 65338

MACROMEDIA Director V5.0

Powerful authoring tool for multimedia and the Internet

Director V5.0 allows you to quickly and easily import and integrate media elements such as 2D and 3D graphics, animation, sound and digital video from a wide variety of sources to create stand-alone interactive applications. With the included Shockwave for Director, you can optimize and deliver high speed interactive multimedia productions on the Internet!

- ✓ 2D animation program
- ✓ Built-in paint program
- ✓ Full featured text tool
- ✓ 2 sound channels for voice over and music

Upgrade, CD **\$366.91** CDW 66958

Full version, CD **\$817.78** CDW 66957

Connectix RAM Doubler 2

Triple your memory

Connectix RAM Doubler 2 triples your memory so you can run more applications and increase productivity.

- ✓ Works with as little as 8MB or as much as 84MB
- ✓ Lets you choose the right amount of additional memory you need
- ✓ Installs in just seconds and works automatically every time you start your Macintosh
- ✓ Memory compression is up to twice as fast as the original award-winning RAM Doubler 1x**
- ✓ Compatible with a full range of Macintosh hardware, software applications and entertainment titles

PERIPHERAL ENHANCEMENTS CORPORATION

WORLDWIDE MEMORY MANUFACTURERS

800/640-0733

Founded in 1986, Peripheral Enhancements Corporation, (formerly Peripheral Outlet, Inc.) is a leading worldwide manufacturer of computer memory upgrades. Our ten-year relationship with our customers is one built on mutual trust and respect. You have no time for problems; that's why our salespeople don't make promises unless they can deliver. Top-quality memory, delivered on time, as agreed and at affordable prices, are the cornerstones upon which Peripheral builds its relationships.

Unsurpassed Technical Support. The Peripheral Enhancements Corporation tech support team stays abreast of the changing memory business, offering reliable, informed answers to your questions. Our easy-to-follow instructions are available with each shipment. Technical assistance calls are toll free!

Lifetime Warranty. Peripheral stands behind every product we sell. We test each and every module prior to shipping. If a problem ever arises with a part, however, send it back for a prompt repair or replacement, often performed within 24 hours of our receiving the part from you.

100% Reliability. Our buyers source top-quality components worldwide and build modules with quality unsurpassed in the industry. Every memory module sold meets or exceeds all original equipment manufacturers specifications.

Aggressive Pricing. Peripheral sells millions of dollars in upgrades every week. Our consistent buying in large quantities assures you a competitive price, every time you order. Order by 6:00 PM CST for same day shipping! * Overnight delivery from \$8.00

*some restrictions apply

Run Your Mac Faster and Save!

PREMIER

**Accelerate Mac LC,
LC II, Color Classic,
IIfx, IIsi, IIfx, or
Performa 600 to '040
Speed Starting at \$199**

Sonnet Presto™ LC 040 50/25 MHz accelerators increase Mac LC, LC II or Color Classic performance 470% as fast as a stock machine (processor performance, MacBench2). Use RAMDoubler or Virtual Memory to break the 10MB barrier with the Presto LC (except Mac LC, OS 7.1+ req'd). The Presto LC is only \$199, or with hardware Floating Point Unit (FPU) \$249.

The 80/40MHz version for the Mac IIsi*, IIfx, IIfx, or Performa 600 increases processor performance by 250-500%. The 80/40 MHz Presto is only \$299, or with FPU and 128K level 2 cache, \$399.

All Prestos are 100% application software compatible and run through System 7.5.5*. The Prestos are easy to install in the Macs' processor direct slot, and come with clear installation instructions. (*Some configurations are not compatible with RAMDoubler or Virtual Memory. Adapter req'd IIsi)

**Allegro's Fast 68030s
Give New Life to Mac
SE, II, IIfx, LC, LC II,
Color Classic from \$99**

Give your older Mac more muscle. Sonnet Allegros™ are packed with features at bargain prices. The 33MHz Allegro LC for the Mac LC, LC II, Color Classic doubles your cpu speed, adds 16K level 2 cache and includes an FPU—all for only \$149. The 33MHz Allegro SE increases performance 460%, includes an FPU and 4 SIMM slots to expand memory up to 16MB for a bargain \$199. Allegro Mac II, IIfx models double '030 speed to 33MHz for a mere \$99.

**150MHz
PowerPC 604
for 7500 \$399**

Give your Power Mac 7500 the PowerPC 604 upgrade it was designed for. This power-packed upgrade is 100% compatible with your existing software and hardware—including cache card. Just plug it in and enjoy the productivity you deserve. *with 601 card trade-in.

66MHz PowerPC 601 with 256K Cache

For Quadra 605, LC/Performa 47X/57X/58X/63X..... \$599

**Upgrade Your
PowerBook 520/540
to 100MHz 603e with
8MB Memory for \$399***

This is the genuine Apple Computer upgrade product designed to bring your trusted PowerBook 520 or 540 into the PowerPC generation with a speedy 100MHz 603e PowerPC processor. With this upgrade you can run all native PowerPC applications the way they were meant to be. Upgrade your reliable ethernet-equipped PowerBook to PowerPC, and prepare for the MacOS future. The upgrade includes 8MB of memory and is compatible with your existing RAM expansion board. *Price after a \$100 discount for trade-in of your existing 68LC040 card.

**Run the Fastest
Quadra Ever!
100/50 MHz is
Faster than 840AV**

Plug the Sonnet QuadDoubler™ into a Quadra 610, 660AV, 700, 900, or Centris 610*, 660AV, 650 and run virtually twice as fast as before for only \$399. No software upgrades or changes are required. Just plug the QuadDoubler into your CPU socket and power up your Mac. A CPU extraction tool is even included to simplify installation. The QuadDoubler includes a Floating Point Unit for superfast rendering or calculations. A cache card is also available for the Quadra 700/900 for even more performance. *The Centris 610 QuadDoubler runs at 80/40 MHz and is value-priced at \$299 (without FPU \$199).

**Add Math Coprocessor to
68040 Macs & PowerBooks**

Give your Quadra, Centris, or PowerBook 520/540 a math coprocessor for rendering, Photoshop, CAD, or other Math intensive applications. 25MHz 68040 \$125*, 33MHz 68040 with heat sink \$169*. Add a full 66/33MHz 68040 with FPU to your PowerBook 520 or 540 for \$249*. This upgrade also speeds 520 to 66/33MHz 540 performance. Call for PB190, Duo280 or 68882 FPU. *68LC040 trade-in req'd.

PowerFPU

Add FPU support to Apple 68K emulator. Run all 68K FPU applications at full speed on Power Mac FPU hardware. Eliminate "coprocessor not installed" errors. 10x faster than Software FPU. By John Neil. \$75

Finally! Windows 95 and Macs Share Files and Printers Both Ways

Workgroups and small offices can now operate as efficiently as an enterprise with **PC MACLAN for Windows 95**. Low cost, plug and play installation, Network Neighborhood and long file name support, are just a few of the features that make sharing files, volumes and printers between Macs and PCs a snap.

"For peer-to-peer networking... PC MACLAN 6.0 is the only choice."

— Macworld - Nov. '96

Create your own network or complement almost any pre-existing LAN. Sharing information between Windows 95 and Macintosh users is as easy as working off your local hard drive. Print jobs go to the printer of your choice regardless of its location on the network.

- Reduce Network Traffic
- Store Images on the Printer's Disk or in its Memory
- Each layer can be moved, rotated, colored, clipped, duplicated, & scaled to your design...

For 101 ways to boost the printing power of any application, call (800) 648-6840 or try our demo at www.mindgate.com

LaserMerge is a print extension that sits between any application and any printer driver... It uses Electronic Paper Templates that you design as a recipe to control any application's output...

Competitive Upgrade
from ANY Print Utility for only \$40

30-day money-back guarantee

System 7 required! Works with ANY printer and ANY application. LaserMerge's miracles require only 32K of memory. QuickDraw GX is NOT required!

AppleVision 1710AV Display

The AppleVision 1710AV display provides a completely integrated multimedia solution for business, education and desktop publishing professionals. It features a 17" Trinitron picture tube (16.1" diagonal viewable image size), a 26mm dot pitch, resolutions up to 1,280 x 1,024 pixels, and an analog and digital screen. Plus it has software controls for user settings and geometry, CD-quality speakers and a voice-recognition capable microphone.

reconditioned \$749

AppleVision 1710

Offers a range of resolution modes up to 1,280 x 1,024 pixels. Features next-generation Trinitron picture tube (16.1" diagonal viewable image size).

reconditioned \$599

Apple TV Video System

Now you can watch TV or videos on your Macintosh Performa 630, 640, 5200, 6200 or 6300 series. Features a cable-ready TV tuner that lets you watch up to 181 channels on your Mac. The system also includes a video card that lets you connect your camcorder, VCR or laser-disc player to your Macintosh. You can capture the images as "stills" or movie clips.

DEMO UNITS \$149

Power Macintosh HPV Card

This is the original Power Macintosh HPV (high-performance video) card. The PowerMac 7100 HPV card comes with 1MB VRAM upgradable to 2MB. 8100 HPV card comes with 2MB VRAM upgradable to 4MB. Each model has 4 VRAM SIMM sockets. For 6100 owners either model can be mounted in the 6100's PDS slot via a PDS adapter (\$100 additional).

1MB HPV Card (upgradable to 2MB)

DEMO UNITS \$179

2MB HPV Card (upgradable to 4MB)

DEMO UNITS \$249

Power Macintosh AV Card

With the Power Macintosh AV Card you add sophisticated audio/visual capabilities to your PowerMacintosh system. After installation, your PowerMac 6100, 7100 or 8100 will include all the features of a Power Macintosh AV-equipped computer. The AV card allows you to view and capture video images on your computer by connecting a TV or VCR. You record video from your computer's monitor onto videotape by connecting the appropriate video equipment. *9100 requires PDS adapter

CALL THE MAC EXPERTS!

Providing complete Macintosh solutions for graphics, pre-press, and video professionals

MacUser Labs Says:

A PowerMax Power Play™ "Not only do the PowerMax monitors display good-looking images, but (they) are affordably priced!" and "Nice price, nice image quality, nice controls - nice monitor!"

PowerMax Trinitron™ Monitors

PowerMax Trinitron monitors are designed specifically for the rigorous demands of the Macintosh. They ship complete with Mac-ready cables and adapters, a three year warranty, and our satisfaction guarantee: if the monitor is not just right, we'll replace it for you!

PERSONALmac

Whether you want
to coddle, catch, kill,
or cook your fish,
your Mac can be your
source for fish facts.

By Christopher Breen

Gone Fishin'

I WAS IN A LITTLE TROUBLE. My Uncle Karl had telephoned the previous week to inform me that he and my Auntie Di would be coming to town for a while, and — oh, by the way — he and I would be doing some fishing. Swell. Me — a guy who's never been closer to a fish than the lox piled on top of my bagel — expected to

hook a live one out in the bug-choked wilderness.

What was I to do? Probably the same thing you, our fish-loving readers, would do: Turn on the Macintosh. Why? Because the Mac supports a boatload of educational and, more important, *entertaining* fish-related multimedia products.

Floundering About

Karl would know something was fishy if I couldn't tell a gill from a fin or a wrasse from a bass, so I decided to begin my expedition with the **OceanLife** series (ⓂⓂⓂ for volumes 2 through 4; ⓂⓂⓂ for volume 5; \$49.95 per volume list), from Sumeria (415-904-0800). Its five volumes cover the exotic aquatic life of the Western Pacific, Micronesia, the Hawaiian Islands, Australia's Great Barrier Reef, and the Caribbean — admittedly a cast of characters we're unlikely to see in California. But I was after the hard facts on fish, and no other Mac multimedia product covers the field as thoroughly as OceanLife.

Each volume contains QuickTime footage of the local underwater inhabitants, accompanied by text and narration describing the habits and habitats of the individual species. Volumes 3, 4, and 5 also each include a section describing

behaviors, such as schooling, spawning, locomotion, and pairing.

Although all the volumes proved extremely educational, the video on volumes 2 through 4 is a bit jumpy and pixelated. (Volume 1, Western Pacific, was under reconstruction and unavailable for review.) Volume 5, The Caribbean, tops the other volumes, with improved QuickTime footage, a new navigation tool bar, maps containing information on dive shops and sites, and a 3-D rotating fish (shown here) complete with labels identifying such accoutrements as the swim bladder and the vertebral column.

Hoping to further increase my piscine knowledge, I then speared several underwater-themed Photo CD collections. The **Fisheye View** series (ⓂⓂⓂ; \$49.95 per volume list) — Reef Collection, Coral Collection, and Fish Collection — from Quantum Leap (800-762-2877 or 305-447-0745), carries high-

resolution images of a variety of ocean inhabitants. But although many of these pictures (125 to 150 per volume) are breathtakingly beautiful, the accompanying narration — an important element

— is far drier than its subject.

Two less successful image collections are **Ocean Magic** and **Aquatic Art** (ⓂⓂⓂ for each; \$19.95 per volume list), from Gazelle Technologies (800-843-9497 or

ANATOMY

Anatomy of Bony Fishes

Bony fishes have a well-developed and complex anatomy. This complexity allows them to live in a wide variety of freshwater and saltwater environments. Click and drag on the fish to view the internal and external features.

619-693-4030). Both contain a plethora of fish photographs (not to mention photos of invertebrates, crustaceans, and coral as well), and they're all royalty free (unlike those in the Fisheye View series). But much of the material is repetitive. A better — albeit far more expensive — royalty-free volume is

Undersea Life ▲ (★★★★; \$249 list), from Digital Stock (800-545-4514 or 619-794-4040). Its 100 gorgeous Photo CD images — which range in resolution from 192 x 128 pixels to 3,072 x 2,048 pixels — include fish, coral, and underwater mammals.

Getting Tanked

Once I had a fairly good idea of what a fish looked like, I decided to find out how our gilled buddies while away their days. And what better way to observe their habits than to set up an electronic aquarium? For this, I had but two choices — **El-Fish** (★★★★; \$9.95 list), from Maxis (800-336-2947 or 510-933-5630), and **Aquazone 1.5** (in beta; price to be determined), from 9003inc (800-401-9003 or 416-487-1777).

Aquazone is a simulation of a fully functioning aquarium: You must feed your fish, change the

water, administer medication, and maintain a certain water temperature unless you want them to become so many lifeless, floating pixels. In contrast, **El-Fish** is more like an exercise in genetics: Take two fish, mate them, and see what kind of small-fry they produce. Although the

El-Fish fish swim more fluidly than those in **Aquazone**, some drawbacks make **El-Fish** less appealing. For example, it takes a *long* time to render each of the offspring, and after your wait, you're pretty much left with only a great-looking screen saver. For the true aquarium experience, look to **Aquazone**.

Gone Fishin'

It then hit me that I hadn't a clue what kind of fishing Karl preferred. Since he lives in Iowa, I figured we could pretty much rule out marlin. But was he a fly-guy or a bait-and-tackle man? Best bone up on both.

For the gentle art of fly-fishing, I had a look at **Fly Fishing: Great Rivers of the West** (★★★★; \$24.95 list), from IVI Publishing (800-754-1725 or 612-996-6000). It gives you travel and fishing tips, although the fishing lessons aren't extensive. It includes written instruction and QuickTime movies demonstrating such basic techniques as "landing a fish" (pulling it out of the water) and getting the right gear. The main thrust of the program, though, is to take you on a tour of six western rivers — the Deschutes, Green, Henry's Fork, Madison, San Juan, and Yellowstone. It shows you scenic photos of each area and has maps

with likely fishing spots. It also gives plenty of travel info, from lists of lodgings to names of fishing guides who can answer all your specific questions once you've reached your fishing destination.

If Karl turned out to be a Bass Master, I figured **Trophy Bass** ▼ (★★★★; \$54.95 list), from Sierra On-Line (800-649-4904 or 206-649-9800), would teach me what to do. Although I had a great time reeling in the big boys in the game portion of the program, I was out of my league once I shifted to the instructional side. Less experienced anglers will likely be overwhelmed — there are, for instance, a jillion

Karl's dead fish into a Creole classic with the help of this CD-ROM, it couldn't be done, by gumbo (see recipe No. 798).

Internet for the Halibut

Finally, I was nearly prepared. To fill in any remaining gaps in my knowledge, I took a stroll around the Web and discovered several swimmingly wonderful sites.

For starters, the Monterey Bay Aquarium — in this author's humble opinion, the greatest aquarium on earth — has an incredible Web site (<http://www.mbayaq.org/>). At J.P.'s Fishing Page (<http://www.geo.mtu.edu/>)

lures and colorful doodads that require a fair amount of rummaging around in the CD-ROM to figure out — but anyone with knowledge of bass fishing should find **Trophy Bass** enjoyable.

Hook, Line, and Dinner

By now, I was feeling pretty confident — that is, until I thought of the following: What if we were to actually catch a fish and Karl wanted to eat it? Even though Aunt Di had cleaned and cooked her share of Karl's victims over the years, I knew she wasn't about to do so on her vacation. Returning to the software pile, I emerged triumphant with a cool new electronic cookbook — **Williams-Sonoma Guide to Good Cooking** (★★★★; \$39.95 list), from Broderbund (800-521-6263 or 415-382-4400). This disc's 1,000 recipes (137 of which are seafood-related) are searchable (by, for instance, ingredients or caloric content) and beautifully photographed, on — wouldn't you know it — Williams-Sonoma cookware. If I couldn't turn

~jsuchosk/fish/fishpage), you'll find links to more fishing sites than you can shake a pole at. To learn about bass, bass, and more bass, check out Bass Anglers Sportsman Society (<http://www.outdoors.net/bass/index.html>). And finally, aquarium enthusiasts will find useful info at FINS (Fish Information Service; <http://www.actwin.com/fish/index.cgi>). To take the shortcut to the famed Fish Cam, hold down Control-Option-F in Netscape Navigator.

Here's the Catch

My time with Karl couldn't have been better. He arrived with a nasty cold and, despite my coaxing, refused to budge from his couch and hot-water bottle. We whipped up a batch of fish sticks, flipped the tube on to *Jethro's Wide World of Bass Antics*, and traded stories about The One That Got Away. Now that's my kind of fishing. ☺

Occasional scuba diver and MacUser contributing editor Christopher Breen did not harm any fish in preparing this article.

"16 Years of Innovation and Excellence"

The Game Room

BY ROMAN LOYOLA

BEFORE THERE WERE VIDEO GAMES, there was pinball. And before there were pinball machines, there were board games. This month I look at how well those games work on the Mac, reviewing two pinball simulators and a computerized version of a classic board game.

Pro Pinball

When Starplay Productions released *Crystal Caliburn* and *Loony Labyrinth*, it set a precedent in giving a realistic feel to Mac pinball games. The problems with the Starplay games, though, were that the layout of the table wasn't used effectively and the ball looked like it was floating on an invisible layer just above the surface.

After the release of those two games, I didn't see another realistic Mac pinball game — until now. *Pro Pinball* will satisfy your need for an electronic pinball game that feels like the real thing. Even better, it has an improvement over the Starplay games: The ball actually looks like it's rolling on a surface rather than floating.

Pro Pinball offers lots of items to shoot at, such as two ramps, a couple of spinners, and lots of targets. Its multiball mode adds to the challenge. The balls have good bouncing power, which is useful when a ball's in play on the table. At other times, it's a disadvantage — it's unrealistically hard to control the ball when you're trying to cradle it with a flipper.

GAME POINT

Pro Pinball ★★★

Price: \$39.95 (list).
Company: MacPlay, Irvine, CA;
800-462-2752 or 714-553-3530;
<http://www.macplay.com/>.
Reader Service: Circle #420.

3-D Ultra Pinball: Creep Night ★★★

Price: \$49.95 (list).
Company: Sierra On-Line, Bellevue, WA;
800-757-7707 or 206-664-4343;
<http://www.sierra.com/>.
Reader Service: Circle #421.

Scrabble ★★★

Price: \$39.95 (list).
Company: Hasbro Interactive, Beverly, MA;
800-638-6927 or 508-921-3700;
<http://www.scrabble.com/>.
Reader Service: Circle #422.

The object of *Pro Pinball* is to complete six missions. With each mission, a different animation appears on the table top. The animations add variety, but they also divide your attention — get too involved in watching the animation, and you can lose your ball. If you want to see the animations, you'll need to practice using your peripheral vision.

I still prefer *Crystal Caliburn* and *Loony Labyrinth*, because I like their pace better. But *Pro Pinball* has great action and excellent sound and, most important, it *feels* like pinball.

3-D Ultra Pinball: Creep Night

Sierra's sequel to *3-D Ultra Pinball* doesn't have quite the same realistic feel as *Pro Pinball*, but that doesn't mean it's not an enjoyable game. The strength of *3-D Ultra Pinball: Creep Night* is in its variety of tables and other features.

In *Pro Pinball*, you have one table to play; *Creep Night* has three tables from which to choose (shown here). The other big difference is that the tables in *Creep Night* aren't constructed like traditional pinball tables; instead of being long and vertical, *Creep Night's* tables stretch

across your screen horizontally. They can be divided into a central table and two peripheral ones. Having so much variety on your screen simultaneously adds to this game's replayability.

As you may have guessed by the title, the theme of *Creep Night* is a haunted house (a cartoonish one). The goal is to close a vortex evil creatures use to travel from the underworld to the earth. There's lots of stuff to shoot at on the tables, and there are also unique features, such as cranes that pick up your ball, wandering targets to shoot at, and a video-game mode you can access if you make the right moves. Unfortunately, the arcade-like game you play in this mode detracts from the overall quality of *Creep Night*. It's simplistic and feels as though it's been thrown in just for the sake of variety.

You'll need plenty of RAM to play *Creep Night* — it requires 11 MB, but I had to boost the RAM requirement to 15 MB on my AV Power Mac 7100/66 in order to get the game to run smoothly.

In all, *Creep Night* is a good video pinball game. Its haunted-house theme is more cute than scary. The game isn't as realistic-feeling as *Pro Pinball*, and it needs a lot of RAM. It does have some unique features that create an interesting effect — it feels more like a video pinball game than a pinball simulator.

Scrabble

My parents wanted me to take a college-prep vocabulary class in high school. I threw a fit and took the class I wanted to take instead: BASIC programming. Later I found out it was their secret passion to have a

son who reigned as the world champion in Scrabble. Maybe they had the right idea. I still haven't used my BASIC knowledge to review games, and this month in particular, I sure wish I knew more words that begin with *j* and end in *u*.

There are plenty of reasons to improve your Scrabble-playing skills by using the electronic version of this familiar game (shown in the background). It has much of the charm of the original and should satisfy Scrabble aficionados.

You can play it on a LAN or over the Internet. Playing against others on a computer may not be the same as huddling around a board, but it does let you play with friends all over the world.

Scrabble has an annoying opening-cut scene that can't be avoided. The music gets tiresome — but you can turn it off. The board is angled on your monitor, which means that letters near the top are smaller than letters at the bottom — it's sometimes hard to see the top ones, as well as the bonus squares, if you're at a distance from your monitor. Scrabble also has some features you can't get from the board-game version — a built-in dictionary to make it convenient to challenge an opponent's words and a hint feature that gives you suggestions for words based on your tiles.

If you're always losing tiles, can't find a worthy opponent, or simply want to play Scrabble over the Internet, you'll find this game a must-have. 

Roman Loyola, a MacUser associate editor and the keeper of The Game Room, is disappointed that his first name is worth only five points.

ANDY IHNATKO

Dear Shareholder:

HII I'M ANDY of Apple Shareholder Relations . . . and I'm taking "time out" from our hectic days of developing advanced Hardware and Software Concepts to bring some good news to you, our Happy Happy Stockholder!

Why "Happy Happy"? Because you're one of the cutting-edge "early adopters" of our breakthrough stockware platform and one "Happy" just won't cover your delight at the news this letter will bring you!

Enclosed is your first-quarter dividend for 1997. Yes, *dividend*. At Apple Shareholder Relations, we have been just as alarmed as you by the "analysis" practiced by certain New York-based "investment advisors" and "financial journals." Far removed from the technology scene here in Silicon Valley, they're hardly qualified to judge the marketability of breakthrough technologies such as NewtonGI, the first truly *Personal* Digital Assistant that can be operated gastrointestinally. Furthermore, we at Apple take extreme umbrage at the *Journal's* injudicious use of the phrase "Better to invest it in the production of a Bob Hope/Dennis Rodman buddy-cops movie."

But the dividend you now hold in your hand is "proof positive" of their shortsightedness. And please examine it closely . . . surpassing even the most optimistic forecasts of those in the Media, this dividend provides temperature readings in both Fahrenheit and Celsius.

"Yes, Andy," you're saying. "This concrete and highly practical demonstration that my investment in Apple is a sound one has indeed made me Happy. But what about the 'Happy Happy' with which you opened this letter?"

Well, I'm saving the best news for second. We at Apple are never content to sit on our laurels, reaping Shareholder benefits solely from our breakthrough concepts of the past. And

so, after months of detailed market research so expensive that you'd be really impressed but, we wish to stress, not so expensive that you might start to look hard at Compaq, we're ready to begin a brand-new Apple venture.

We held extensive focus-group meetings, asking hundreds of qualified consumers to rate over 1,000 proposed products and product lines. And the results, tabulated by an accounting firm not unlike those working for many Fortune 500 companies, conclusively identified one unique technology absent from *all* of our competitors' product lines, one surefire profit opportunity

that all of those questioned identified as a product they intended to purchase within the next month: Food.

Yes, we at Apple don't know why we didn't think of it ourselves, either: an enormous chain of themed cybercafes, offering a variety of Food™ and Coffee™ for customers to buy directly from Apple, avoiding the costly and sometimes persnickety VAR channel. In the most strenuous if not legally binding terms, I promise you, our valued Shareholder, that this is a can't-miss opportunity. Why?

1. Location. We will place our first Apple Cafes in Los Angeles and New York City. Owing to the ever increasing number of broadcast and cable-TV networks creating original programming, it is inevitable that eventually there will be a sitcom featuring attractively unemployed Twentysomethings who hang around our Coffee™ shop all day and night. Translation: *free national publicity*.

2. Hot, hot, hotness! Pick up a People magazine. Inside you'll find photos of top TV comedians such as Dan Aykroyd and John Goodman at The House of Blues; Hollywood megahypersuperstars such as Bruce

Willis, Demi Moore, and Arnold Schwarzenegger at Planet Hollywood; supermoguls such as Steven Spielberg and Jeffrey Katzenberg at Dive; fabulous supermodels at The Fashion Cafe. The message is clear: Celebrities *love* to hang out at theme restaurants! And don't think the Coffee™-drinking, star-crazed public doesn't know it! Who *wouldn't* scramble into an Apple Cafe for a glimpse at gold-plated glitter gods? And while they stare goggle-eyed at Sylvester Stallone, Quentin Tarantino, and Harrison Ford, they'll be gulping down \$3 cup after \$3 cup of Folgers Instant.

3. Chemical addiction has become an ugly phrase of late, but nonetheless the stock exchanges are full of highly profitable companies reaping megabucks for their Shareholders from the pythonlike stranglehold their *completely legal* products have upon the neurochemistry of their quivering customers. And unlike tobacco cravings, caffeine addiction is still fashionable!

4. Furthermore, unlike heroin addicts, Coffee™ addicts are actively and adorably *grateful* to anyone or anything who or that can bring them coffee. Scratch a dog behind its ears, and an hour later, it's bringing you your slippers. Supply a Coffee™ addict with a cup of our patented Ultra-Viscosity Kenyan Jumper Cablecino, and with one hand, she'll hand her waiter a Visa Gold card, while the other points to a \$9,200 Power Mac digital-video system on the wall.

The list, we claim, is endless. Our main competition has been making a fortune quarter after quarter by marketing good ideas years after others have already done them to death. Now, we at Apple are pleased to say, it's time for Apple to put this time-tested principle to work for you, our Shareholders.

P.S. The postage meter here at Apple Shareholder Relations seems to be on the fritz again. Please make ten copies of this letter and send a copy to each of the Shareholders on the attached list, first deleting the bit about the first-quarter dividend. We'll pay you back later. ☹

Introducing PowerBase™ from Power Computing.

180, 200, 240MHz Mac™ OS systems starting at just \$1,495.

Meet PowerBase. While your kids sleep at night, this is where you will plan their future and chart your dreams. This is where you may write the next great novel or the business plan that changes your life.

PowerBase is a powerful Mac™ system that handles Photoshop™ as easily as Kid Pix™, edits real video as easily as it runs educational software, and plays the latest 3D games as easily as it surfs the internet and balances your checkbook.

MacUser magazine awarded PowerBase their coveted "five mice" rating and Macworld gave PowerBase their prestigious Editor's Choice Award easily beating out all other 603e-based systems from Apple, Motorola and Umax.

PowerBase is simply the best Mac available for home, school or small business.

Complete Internet Solution

PowerBase 180, 200, 240MHz

- Upgradeable 180MHz 603e
- 16 MB RAM (160 MB Max)
- 1.2 GB IDE Hard Drive
- 8X CD-ROM Drive
- 256K Level 2 Cache
- 2 MB Accelerated Video (4 MB Max)
- Built-in 3D Video Acceleration
- 3 PCI Expansion Slots
- 14" Color Monitor
- Global Village Platinum 28.8 Modem
- Apple Internet Software Kit
- Extended Keyboard and Mouse
- External Labtec Speaker Set
- \$1,000 in Bundled Software

\$1955 200MHz Just \$2255
240MHz Just \$2655

Complete Home Office Bundle

PowerBase 180, 200, 240MHz

- Upgradeable 180MHz 603e
- 32 MB RAM (160 MB Max)
- 1.2 GB IDE Hard Drive
- 8X CD-ROM Drive
- 256K Level 2 Cache
- 2 MB Accelerated Video (4 MB Max)
- Built-in 3D Video Acceleration
- 3 PCI Expansion Slots
- Power 15" Multimedia Display (vis.13.7)
- Microsoft Office 4.2.1 Bundle
- Intuit's Quicken Special Edition
- Extended Keyboard and Mouse
- External Labtec Speaker Set
- \$1,000 in Bundled Software

\$2265 200MHz Just \$2565
240MHz Just \$2965

Complete Multimedia/Video Editing System

PowerBase 180, 200, 240MHz

- Upgradeable 180MHz 603e
- 24 MB RAM (160 MB Max)
- 2 GB AV Compatible SCSI Hard Drive
- 8X CD-ROM Drive
- 256K Level 2 Cache
- 2 MB Accelerated Video (4 MB Max)
- Built-in 3D Video Acceleration
- 3 PCI Expansion Slots
- Power 15" Multimedia Display (vis.13.7)
- Digital Video Full Screen Video In/Out
- Adobe Photoshop/Premier LE Software
- Extended Keyboard and Mouse
- External Labtec Speaker Set
- \$1,000 in Bundled Software

\$2845 200MHz Just \$3145
240MHz Just \$3545

PowerBase systems feature a 30-day money back guarantee and extended on-site service packages are available.

PowerBase Features:

- Upgradeable CPU
- Exclusive 2D/3D Rage™ Video
- 2MB VRAM (Millions Colors on 17")
- 8x CD-ROM
- \$1,000 in Bundled Software
- PS/2 Mouse & Keyboard Support
- Only "Five Mice" Rated 603e System

WE'VE RADICALLY REDUCED PRICES AND DELIVERY TIMES.

THIS SYSTEM RENDERS FAST, COPIES FAST, LAUNCHES FAST, ROTATES PHOTOSHOP FILES FAST, AND NOW IT EVEN SHIPS FAST!

No more waiting. Power Computing's backorder is over!

We figured out a few months ago that the best thing we could do to improve our award-winning product line was

"THE POWERTOWER PRO SERIES SOARS ABOVE ALL MAC RIVALS....MAC POWERUSERS WILL SOON BECOME POWER COMPUTING USERS IN DROVES"—MACWEEK MAGAZINE 7.22.96

to substantially increase our manufacturing capacity to meet growing demand and ship more systems faster.

"POWER COMPUTING HAS THE CLEAR AND UNDISPUTED EDGE OVER APPLE IN BOTH PRICE & PERFORMANCE. YOU WANT A POWERTOWER PRO."
—MACUSER MAGAZINE SEPT '96

We've slashed prices on our PowerTower™ Pro series!

But that's not all we've done. We've also lowered prices on

♦♦♦♦♦ our PowerTower Pro series by up to \$700.
MacWeek

Custom configuration anyway you want it.

Finally, you can customize more than just your desktop icons. We build every system exactly to your specs. Need more RAM or a larger hard drive? Want internal RAID or AV options? Not a problem - we'll build and ship it directly to your door. Direct, from the factory, just like Dell and Gateway.

There are other 225MHz systems out there, but the PowerTower Pro is still the best and fastest.

That's probably why the PowerTower Pro was the only 225MHz system nominated for product of the year by the editors of both Macworld and MacUser magazines.
